RF350 Users,

Would you like to add Computer Control to your Harris Radio? Please visit my website, http://www.ko6no.com, for information about an RS232 Remote Adapter for your RF350.

Thank You and 73.

Ken Fowler
KO6NO

Mark -

For classic restorations or antique lamp designs -- look at SunDial Wire !
http://www.sundialwire.com/

Large selection of options - sample available
http://www.sundialwire.com/index.asp?PageAction=VIEWCATS&Category=222

SunDial wire is manufactured with real cotton braid, for an authentic
vintage look and feel; yet, beneath the cloth covering, is a PVC insulating
jacket that meets UL standards for heat resistance up to 105 degrees
Centigrade, so you can be assured the wire you are installing is safe.
(Please check the details of the specific wire(s) you are considering buying
for information on whether or not it is UL-rated and the heat and voltage
ratings for that wire.)

Vintage Fans performs full restorations of classic antique designs.
http://www.vintagefans.com/

They also carry wire for restorations
http://www.vintagefans.com/new_wire.htm

Radio Daze carries cloth covered hook-up wire for internal (Radio, etc.)
restorations
http://www.radiodaze.com/wire-cloth_covered.htm

Automatic restoration? Here is the wire for your classic antique automobile
http://www.magnetoparts.com/wire.htm

Need cloth covered wire for a telephone restoration?
Odis LeVrier in San Angelo, Texas bought the 2 weaving machines from Western
Electric !

A quick search on eBay.co.uk for "cloth cord" threw up a surprisingly large
selection,
particularly in the shops, available to US, Australian or EU standards, for
starters,
(some from 1942, which I wouldn't trust, but mostly new production)
and a search for "lighting flex" gave yet more.

My next project is an RF exciter for my 8000 rig.

For sentimental reasons, an 807 must be part of it.

In browsing around, I find the Viking Adventurer to be just about what I want to do. I found the schematic on BAMA but they do not seem to have the parts list which would save a lot of trouble.

Does anyone have this or know where I can get it?

Thanks,

JACK K9ACT http://schmidling.com/radio.htm

Some great specialty cords there at Sundial, but a bit spendy for my blood.

Radio Daze doesn't just have cloth hookup wire, they also have nice cloth power cord for about a quarter a foot.

Jack,
How about getting the Viking Adventurer Manual?
You will still need a VFO.

The speaker has been eBaying for $50 to $80 by itself.

The radio, in good condx is typically in the low to mid $100.

The pair should be $200 - $225.

Hello,

Just received a Hallicrafters SX-28, made for the FCC. This unit seems unusual where all three bezels (tuning, bandspread, s-meter) are mounted onto a removable rectangular plate. That whole plate, plus everything on it (including the s-meter, dial lamps...) is gone. I have a gaping hole and bare dials.

Does anybody have a junker SX-28 that I could take this bit, or the entire front panel assembly from? Sell/trade?

Thanks,

David Goncalves

I never fully understood why Hosstraders was on Friday and Saturday rather than on Saturday and Sunday, since lots and lots of people can't get out of work on Friday.

So now, I guess my question is, why is NEARfest doing the same thing?

(Looking forward to it in any case...) :-)

Ken, this is a great idea!

From the manual on your web site, it appears that the audio channels
are brought out to the DB25 connector and that the baud rate could be
jumpered for 9600 thus making your board compatible with the Harris
RF-352 (C-11329/URC) Remote Control Unit. (At least in RS-232 mode,
obviously two/four wire or RS-422 would not be supported.)

Is that correct? Is your board compatible with the Remote Control Unit
(with those restrictions) or is it intended for use strictly as part of
a software solution?

Either way, this is still a great idea and it must have been a
significant engineering effort. Very commendable -- thank you!

Coax relay, SPDT, SO-239 contacts, auxiliary contacts, 115 vac coil, in reasonable condition.

I am re-assembling a 1960s class Novice CW and early General station and need this relay in reasonably usable condition.

My schedule does not allow me the luxury of 'lurk & jump' on eBay. So, I'm making this direct request.

Direct email to above address.

Thank You Hank.

I don't know. Maybe someone in the MARS community has a Remote Control Unit to test it. If the
C-11329 can get by with RS232, it should work. It looked to me like Harris used the 300 Baud Audio
Modem to connect various units like tuners and amplifiers. I used four of the RS422 pins for RS232
Handshaking and there are no provisions for the Telephone Modem. I also left out the connections
for AUX TXD and AUX RXD because they don't go anywhere. We found that some of the commands did not
work when the jumpers were in the non-ADAPT baud settings. The radio would return its status and
would change frequency but there was no control of Mode or AGC. There are also differences in
Command vs Response between the V601C and V604M EPROMs. Our intended use is as a CAT opertion.

Thank you for your comments.

Ken Fowler

1497. Hallicrafters SX-28 in need of front panel, other parts

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-04-25 23:15:43 UTC
From: Dave Goncalves <davegoncalves@gmail.com>
Message-ID: <1177542942.932137.308600@u32g2000prd.googlegroups.com>
Source record: 8143

Hello,

I recently received an SX-28 from a buddy of mine. It is 'mostly'
there, except for the following:

1. Where the dial and s-meter bezels should be, there is a neatly cut
12" rectangular hole.
It looks like it was milled out. Whether this was a Hallicrafters mod
or a fool trying to add something like a linear scale, I don't know.

2. No S-Meter

3. No dial pointer mechanisms - just one dial lamp hanging on a cord.

First Question: Has anybody seen this modification before?
Second Question: Does anybody have a front panel, dial and s-meter
bezels, pointer mechanism, etc. that they could part out from a scrap
unit. Or, does anybody have a scrap unit in the New England area they
would like to sell?

Thanks,

David Goncalves

That's a little different. People take their vacations and go to Dayton.
By Sunday it's time to head home to Phoenix or Minneapolis or Boston so
they can go to work on Monday.

NEARfest is (as Hosstraders largely was) a regional event. People might
drive 100 or 150 miles to go there, but few came from farther away than
that. Typically, relatively few will want to take a vacation day (if they
can even get one) to go there on Friday. Some will do it anyway, and
will join all the retired people and the self-employed people and the
people who don't work M-F 8-5, but all in all it would be a lot better for
everyone if they'd hold it on Saturday and Sunday.

I don't recall seeing anything like that before, but anything is possible. Hams in the 1950s delighted in doing "mods," and/or re-using scavenged parts, for better or for worse :-)

I can't help with the meters and other hardware, but I do have a great .PDF art file of all the SX-28 dials in exact scale, courtesy of Doug Moore, which you could use to reproduce all of them if you figure out the hardware situation.

This art is not for commercial use, so if you contact me via http://antiqueradio.org/contact.htm , I will send it to you in personal email. (Don't do a Reply to this message.)

Hi'ya Jack,

My Viking Adventurer is on the air nightly. In fact for over 2 years it has been my "primary" rig and that is using only crystal control.

I am sure you can find the parts list on BAMA but if not send me an SASE (via my QRZ.com address) and I will photocopy it for you.

Good luck.

Check your local sewing machine repair outlet. Some old Singer machines use
the same cord.

1512. Sprague TO-4 Capacitor Tester (warning and repair notes)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-04-27 01:49:15 UTC
From: Edward Knobloch <alias@nowhere.net>
Message-ID: <vEcYh.5180$Zm.4375@trndny03>
Source record: 8058

Hi, Gang

I recently repaired a Sprague TO-4 capacitor tester.
In the process, I found that the Sprague can actually damage
electolytics under test, depending on their capacitance value.

The problem is that Sprague uses 85 VAC across the bridge elements
on the 0.1 to 50uF "C3" range (power transformer taps 8 to 10)
There is a fixed 2uF capacitor in one leg of the bridge.
So, if you are testing a 1uF capacitor, it will have 2/3
of 85 VAC across it, or about 60 VAC. This is not good,
especially if you are testing an electrolytic capacitor with a low
voltage rating. Testing a 40uF capacitor would be OK, it will only have
about 4 VAC across it.

Sprague uses 155 VAC across the bridge (transformer taps 6 to 10)
for the 45 to 2000 uF "C4" range,
with the same 2 uF capacitor in one leg. A 45 uF capacitor will have
about 7 VAC across it, using this range. Not too bad, but the test
shouldn't be prolonged.

The Sprague TO-4 is filled with "Black Beauty" paper capacitors, which
should be replaced automatically, due to their dismal reliability.
Interestingly, the original power supply electrolytics (ca. 1952)
tested fine. For safety's sake, change the power cord to a 3-wire
cord.

If your main potentiometer fails, you may have trouble finding
the large Clarostat 7.5K linear wirewound, since that value
is no longer manufactured. The pot carries military designation
RA30NASD752A. I replaced the pot with a 20K pot, military type
RA30NASD203A. (If the last letter is other than an "A",
the pot is not linear). Resistor R6 (150K) was changed to 400K
in order to maintain the calibration of the "C4" range, after the value
of the main pot was changed to 20K.

For future reference, here are the transformer winding voltages,
none of which are included in the Sprague TO-4 manual:
term. 6 to 8 70 VAC
8 to 10 85 VAC
1 to 3 440 VAC
1 to 5 665 VAC
1 to 7 715 VAC
1 to 9 850 VAC
(Measured with a 125V line voltage input).

73,
Ed Knobloch

Jack,

Here are some more shreds and shards of information. According to the 1959 Allied catalogue there were 5 different "LS3" coils sold with differing catalogue numbers. Each is advertised with a paper-based phenolic core and the slug for the LS3 is described as "a larger slug" (as opposed, I suppose to a smaller iron slug on the other coils in their line). No L value is mentioned in the 1959 or any other copies of the Allied catalogue that I have. Each of the five LS3s is described with a coil that is 1 1/8' x 3/8-inch diameter. They produced the following LS3 coils: 1 MC, 5 MC, 10 MC, 30 MC and 60 MC. If I knew the wire size I might be able to come closer to deducing an L value.
Good luck.

There are manuals for the HQ-170, HQ-170A, and HQ-180
on the BAMA site and its mirror. The mirror is better
because the original site is limited to ten users at a time
and is sometimes hard to download from.

Well I have had my HQ-170 for a while now. I restored one that I bought on Ebay for about $200 including shipping. A local ham had a parts HQ-170A unit that I purchased from him. The HQ-170A has a flip top cabinet that allows you to access the tubes and everything on top of the chassis. I believe the HQ-170A has a solid state replacement for the 5U4GB power supply rectifier tube. There are some other differences in some of the connections on the rear panel. Seems like you can pickup a HQ-170 for a decent price. The HQ-170A VHF models command a pretty high price. The HQ-180's seem to be worth their weight in gold as Bill noted in his message, I also saw the one on Ebay go for $1700+ recently. The only recommendation I would have is to expect to have to do a complete alignment to the receiver and replace C82, the 4 section electrolytic. This alignment can be kinda tricky and you will need to have an accurate 60 KHz signal generator to get the 60 KHz IF's aligned correctly. I am real happy with my HQ-170. I use it mainly on AM on 75 meters with my Johnson Ranger transmitter. 73 de Randy, WB5KCM

Source record: 8078

Funny thing..... If I had one that nice, I don't think I'd sell it, even for over $1k. If the sale is legit, I can only assume that the buyer once had one and is willing to go to any end to replicate his/her early station. And/Or... it could be one of several persons-of-means that are in this hobby that price is never an obstacle.

All of them have been going for from $400 to $700 over the time that I have been watching (last couple of months). Then we have ONE of them that goes for $1700++? Doesn't that look a little suspicious to you guys?

On that one auction (270110127334), looks like bidder #3 wanted it
badly...bid a number of times, topping over his previous bids while no
one else even outbid him. Bidder number 5 may have been a shill but it
was already up to $1670 when #5 popped it only $30 more. Then #3 kept
increasing it higher over his previous bid. Nope...I think the seller
got real lucky on this one.

Everything is worth only what someone else is willing to pay for it.

The HQ-180 sold new for $429 in 1959. In today's dollars, that would
be $2,993. From that perspective, and the fact that the HQ-180 is a
desireable collectable, $1,725 seems like a bargain.

Unless bidder #3 was the shill, and had no idea what he was doing...

I would be amazed beyond belief if the sale actually goes through and the
radio actually changes hands at that price.

I was at a ham swap meet in Spokane Washington back in the 80's. A
guy had a same-as-new factory wired Johnson Ranger II for $100. I
didn't think I would ever have a use for it, so I passed. Kicking
myself ever since.

I watched that ranger when it was first listed with a minimum starting bid of $500.

I thought it was outrageous then and I still do!

I think it's just a sign of the times. Have you seen the muscle cars
going for over $1-million at action? That seems a little outrageous
too! Especially when we paid $3,200 for a brand new 1967 Pontiac GTO.
People want these things and are willing to pay an arm and a leg for
them. The prices for things no longer produced are only going to go
up if there is a market for them.

I have an RCA RadioMarine AR-8506A (R-203A) receiver. Other than those installed on Liberty and Victory ships (part of the 4U radio system), can anyone tell me where else they were used? My particular unit has what appears to be a (typical) Signal Corps inspection stamp on the front panel and has the heavy steel/brass shockmount case with it. Those installed in the 4U systems don't use the case. Inside the case there's a stamped placard with a statement regarding Maritime Commission approval. I believe I heard somewhere that the Corps of Engineers used these on their ships and dredges? Anyone know? Thanks much.

1539. Signal/One MILSPEC 1030 HF transceiver for sale

Newsgroup: rec.radio.amateur.boatanchors

All,

Our Signal/One MILSPEC 1030 transceiver is now for sale on eBay:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=230123960885 .

This is the 150 Watt version. I recently made several QSOs with it, on all the bands that were open at the time, so we believe it to be completely functional and know of no performance problems. It has only minor scratches on the sides and top, and comes with the manual, AC power cord, and 12 VDC power cord.

Sales notices are supposed to be upbeat, but it's difficult being upbeat when you are selling such a wonderful rig!

73,

Ed Callaway, N4II
Motorola ARC, W4MOT

Anybody know if they are still in business or not? I submitted a web order for a TS-375 manual quite awhile ago which was not acknowledged. I've tried calling and there is no answer.

Any help would be appreciated, including a source for a TS-375 manual.

I had the same problem several weeks ago. It took
several e-mails to get action. They did not acknowledge any
of them and were not available via telephone but I
eventually got the manual I ordered. I have a feeling its a
one person operation.

The one time I called and got an answer - it "sounded" like an "elderly"
lady. And I believe someone said - around that point in time, it "was" an
elderly lady doing so. Not sure what the deal is now.

Oh Ed......my...my...my.....

Only $2000 for an OLD obsolete HF rig. Anyone can do better than that with a phone call to a dealer on a NEW rig.
Your ad says "No reserve" but it STARTS at $2000........uh-huh....That's called a "Reserve" Bunkie.
You say it works perfectly, but NO GUARANTEE once it leaves your hands.....yeah right....
"Such a wonderful rig"...oh please....give us SOME credit......were not THAT stupid.

Typical HAM radio operator....Wants to STEAL it when HE buys it..then wants "Top Dollar" for it when he sells it.....

>This is a MUST read before you plunk down $2000 on this electronic Edsel....

It is an interesting article, but note that the author has SEVEN of
them and is looking for another one. Just because the company went
belly-up, that doesn't mean that the Signal One is still not a highly
collectible radio.

Hey Jeep, I remember working on a couple of those receivers years ago.
I used to see them back in the 70's and early 80's, I used to work for
ITT Mackay in Houston. RCA had a service depot back then that usually
did all the service on the RCA consoles. I did work on a few of the
RCA consoles and did FCC inspections on them back then. They were real
common on a lot of American commercial ships. I remember a battery
operated RCA regenerative receiver, I cannot remember the model. It
was used for the emergency receiver and it was very sensitive and was
great for receiving on the medium frequencies. Hopefully someone will
give you a lot of good info on this AR-8506A. 73, Randy, WB5KCM

I have about 5 of these "amplifying Transformers". Type Audio ATX. 4
connections on the top of the round black
enclosure. Positive B Grid Plate & reg fil or bias. Not sure what
these might have been used on. I got them in an
estate sale. If they are of any use to anyone..I can send a digital
pic or two and I would sell.

Message-ID: <133g54grvi563d1@corp.supernews.com>
Source record: 7997

I bought the Ranger for $150 and it was a basket case not even worth
that much.

I spent several months off and on restoring it to good working condition.

I am not a nostalgia buff and built my own rig using the Ranger as the
driver. I have since built my own speech amp and RF exciter and have no
further use for the Ranger.

Seems like several months of re-building ought to be worth a $10 grand
or so but I will settle for $150, i.e. $300 plus shipping.

Email for more.... some pics at http://schmidling.com/radio.htm

Subject:Icom IC-230 help wanted

I acquired this modern boatanchor for $000.00 and surprise-surprise; it doesn't seem to want to transmit. I guess I could check the mike first, but other than that, does anyone know the common problems for this rig?

Thanks

My vintage VHF rig is acting up after almost 30 years
of service. The 2-meter module is slow to produce
RF output when keyed. I suspect a sluggish oscillator.
The relays have been cleaned. Once it starts running,
the TX cycles are good, until the radio is left unused
for a period. Has anyone seen this before? Solutions?
I had it apart on the bench but could I was never
quick enough to catch the fault.

The 6000A is not a half-bad tester other than it is limited to the
"modern" type standard-based & compactron-type tubes and will not test
4/5/6 pin tubes without adaptors. It is smaller than the TOL Hickoks
(such as the 539-series), and it is not set up to do matching or with
variable bias.

As tube testers go, it is about the least one would expect from a GM-
type tester and as it is a GM, superior to an equivalent emissions-
only tester. But only just.

I will not comment on price. That is between the buyer and the seller
and their respective gods.

Oh, the non-believers....
Well, anyone that knows anything about the Milspec 1030 knows that the
cx7 just isn't the same rig, and neither is the 1030ci.

The 1030 was a true mil-spec, hardened and wonderful radio. It operated
without fail over considerable range of conditions, and the remaining
examples probably do so even today. Built like a battleship inside,
with individual milled aluminum compartments for each subsection, it
didn't suffer from many of the maladies of later integrated rigs. For
the uninitiated, the 1030ci was an attempt to cash in on the superior
function and longevity of the original 1030 by taking a commercial 781

and "hardening" it. I am not aware of many individuals that actually loved the result like those that owned the original 1030. I owned one of the original 1030 radios with the high power option and multi-color led display and loved it, though succumed to it's popularity on the collector market and sold it around 5 years ago to a fellow on the east coast. To this day, I wish I hadn't, though it is hard to fault the icom 746pro and 756ProII I now have that were paid for by the proceeds from the sale of the 1030... If I thought I had a chance of winning the current auction with what's in my radio fund, I'd be in the bidding right now, just to have another one!

If you're trying to make waves because of a few bad seeming comments about radios that aren't even the model for sale, then just pleae go away. If you actually truly have experience with the original 1030, then come on, and provide just what you think was wrong with the one you had....

Thanks

>promary) miki.

If you are sure this is a broadband audio transformer, get your scope and a 1KC square wave generator (the calibration generator on the Tek scope is probably good enough. Pick one winding, and apply the square wave, then pick another winding and look at it on the scope. Apply shunt resistance across the scope probe until you see a nice square wave with only a tiny overshoot. Now you know the impedance of one winding. Do this repeatedly and figure the winding impedance of all of them.

From this you should be able to figure out what is intended as the primary and what is intended as the secondary, if you have a vague idea of the intended application.

Now, you can put 6.3V AC across the primary through a capacitor, then look at the secondary on a scope. Use a bench supply to add some DC offset to the primary, and keep craking the DC voltage up until you see the level of the sine wave on the output start to drop off. NOW you know the level of acceptable DC offset current before the core saturates at near-zero power, from which you can fudge a full-power value.

These are the two important things you want to know about an audio transformer. Power level is a little harder but you can just apply 60 Hz into a big load resistor until the transformer saturates. Full power fresponse tests will require an amp, though.

Wow, this was Icom's first sythen. 2-meter radio in 1970s .. ~ 1973 or
1974 -- as I remember.
Locate the schematic, owner's manual and service manual.
http://www.icom.co.jp/world/support/index.htm

Icom has the owner's manual (PDF) on their Icom Japan web site
http://www.icom.co.jp/manual/external/transceivers/IC-230.pdf

A few parts (ICs) may be on hard to find or difficult to obtain lists. I
bet the 12 volt lamps are burned out or have at least been replaced once.
http://www.rigpix.com/icom/ic230.htm

Start with determining IF the radio is drawing any additional current (when
transmitting).
Check T/R relay and then either start with the audio stage and run through
to the RF amplifier.
OR start with the 10 watt RF amp section and work backwards - your choice.

There was probably a test procedure for it but without that or some
TV sets to use it on he's right, more or less. It's only good for TV
work and who fixes TVs? If you are a tube TV collector tinkerer, my
advice, buy it cheap. If you need it you can probably figure it out.

Caught it in the act with the PA apart. It was the PA antenna
relay not pulling in at all times. Cleaned the relay, and
resoldered a few joints, no working as intended.

1572. Adding PL-259 connector

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-05 12:20:43 UTC
From: Unrevealed Source <unrevealed_source@nospam.com>
Message-ID: <9G__h.1592$hl7.1518@newsfe03.lga>
Source record: 8018
Cross-posted to: rec.antiques.radio+phono,rec.radio.amateur.boatanchors

When adding a PL-259 connector to a radio that doesn't have one (a radio that is set up for longwire only), is it OK to just wire it straight in, or is it best to add some sort of impedance-matching circuit? Obviously the long-wire connector is going to be high-impedance, while the coax coming in will be 50ohm.

I often see radios that someone has added the connector. I'd like to add one to an old DX-150A, just for convenience since my longwire comes into the house via coax. A already use a MLB between the longwire outside and the coax; the antenna works great on radios with a 50ohm input.

Any advice? Thanks.

Jeff

Ferrite is cheap. Why not put a 3:1 (turns) balun inside the
radio between the SO-239 connector and the original antenna
terminal.

There's no guarantee that the radio has a defined input impedance to begin
with!
You could try a balun to see what improvement it makes on various stations,
but with a random length wire the antenna impedance is going to be all over
the place. If you're really worried about matching, use an antenna tuner. It
probably isn't going to make that much difference.

Pete

I would add a small series capacitor (maybe 0.01 uF), not for impedance
matching but for safety in case a high-voltage fault develops inside the
radio. As Pete says, the input impedance over a 3:1 bandwidth will be
all over the map. You might match it over a 10% bandwidth. But 3:1? No way.

Just got back from NEAR-Fest in Deerfield, NH, and while I have to say it ain't no Hosstraders (yet), still it was a very welcome event and I enjoyed it, and it has the potential to grow in the full Hosstraders tradition.

Speaking of the "Hosstraders tradition", I was just wondering if anyone knows where the profits from this event are going.

Hosstraders was always held to benefit the Shriners Burn Center (or the Shriners organization in general, I don't recall which), and from all reports resulted in a large check to that organization twice a year. I'm sure they will miss it.

Anyone know which charity (if any) will benefit from NEAR-Fest?

I agree. But, if you run coax outside to the longwire,
a Balun at the feedpoint will mitigate the problem.
Someone did a nice webpage on a system like that,
and it also lessens the pickup of interference generated
by household electrical items.

I don't know if there even were profits and if "Mr. Mike" was the charity I would be fine with that. I cant imagine the amount of effort, grief and time something like that must take.

I have been going to this event since it was in Deerfield 30 years ago and am so happy to have it continue I'd be OK if the profit motive was there.

NSW

Australia at Coffs Harbour are looking forward to making Local or DX IRLP
contacts on Fridays 0315 - 0345 UTC.

Contacts will be on IRLP node 6625 via local repeater VK2RDO on 146.650Mhz.

The young people in the club have been experimenting with building simple FM
radio recievers, and
have been contemplating the design of plasma balls using ordinary light
globes and car spark coils.

Contacts with interested parties or similar school electronic/radio groups
would be great but unfortunately
the club only has limited time during the local lunchtime period.

Also the Bishop Druit College French and German Language classes are
interested in contacts Monday to Friday 0315 - 0345 UTC.

If interested and can help arrange a contact please email:

Gary VK2ZKT gryan@bdc.nsw.edu.au

or

Peter VK2EVB vk2evb@wia.org.au

The following free advice is worth every penny... :-)

When you say you want to put a connector on the radio, do you mean the
male (PL-259) or the female (SO-239)?

Don't worry about matching the impedance. It is relatively non-critical
for short wave listening. However, you may want to devote a little
attention and thought to some kind of lightning protection.

Finally, if you mean an SO-239 to be mounted on the radio, I vote "no",
only because IMHO, it buggers up the radio and reduces what ever resale
value it may have; however, this is just my personal pet peeve.

Yes, as someone else pointed out, I meant SO-239 (the female end). I'm not worried much about resale; it's just an old DX-150A to play with and I've already repainted the case.

I always thought 0dBm = 0.001 watt!! [Zero dB relative to a milliwatt]

I alway thought 125 watts is 50.97 dBm. Guess the rules of power specifications have changed as I've aged.

Well, as this is a solid-state radio, I don't know if a "high-voltage
fault" would be a big issue or not... ;-)

Well, that depends. IF you attach a long wire antenna to a 50 ohm
coax cable, then the coax cable to an input on the radio whose impedance
is changing, that coax cable becomes part of the antenna system and ceases
to be a transmission line.

In the case of a long-wire antenna, the result is minimal. Maybe it
changes the antenna pattern in a minor way, but you won't notice any
real difference.

BUT, now take a highly directional antenna which you are swinging around
to avoid a noise source.... run that into the 50 ohm cable and into the
high-Z receiver, and now the signal pickup on the transmission line will
become a problem.

>Finally, if you mean an SO-239 to be mounted on the radio, I vote "no",
>only because IMHO, it buggers up the radio and reduces what ever resale
>value it may have; however, this is just my personal pet peeve.

And there is no reason not to just make a PL-239-to-pigtails cable, if
you're plugging the receiver into a distribution box or T/R relay that
has SO-239s on it.

I think what the gentleman was implying is that with 0dbm input - the
amp outputs 125W - a gain of (approximately) 51db.

best regards...

I would like to build some tube transmitters and am curious where
other people get their chassis? Article 1 (The Novice Special, from
the arrl website) calls for LMB SQ-1 cabinet (8.5 x 4.5 x 4.5 in)
which "comes complete with chassis and front panel".
Article 2 (A Three-Band One-Tube Novice Transmitter, from Dec '57 QST)
calls for a 2 x 7 x 13 in aluminum chassis enclosed in a 7 x 9 x 15 in
aluminum box.
Any suggestions?
Thanks and 73,
Ross, NS7F

The percussion has the vocalist covered up. I cannot make out any
words. If there is a melody mixed in the presentation, I cannot sense
it. The flashing lights are a major distraction. The harsh lighting
does more to conceal the performance than illuminate it. Twanging a
guitar is OK for a sound effect but I find it annoying after a short
while.
No offense intended, just my reaction.

As information, the latest (and greatest?) iteration of the NTIA Red Book reinforces the spectral purity requirements for the 2-30 MHz band. The purity specification is currently 40db+10logPo. So, a 100 watt rig would need to have all spurious emissions down by a nominal 60Db. Most ham and a lot of commercial gear can't meet that spec. The 20HZ spec has been on the books for some time, now, and is not hard to meet given the current crop of equipment utilizing good quality TCXO's. It remains to be seen what CAP and MARS will do in the short term, and ultimately, with the spectral purity spec.

Finally, the VFOs in Drake and Collins equipment can't come close to making any of the above specs or even coming close. Frequency tolerance is the one factor that can be easily and accurately measured, at a distance.

As I recall, this is a device that does dynamic characteristic curves
in-circuit.

As such, it's not useful for anything unless you have a nominal set of
curves available. The manual has curves of a bunch of old TV sets, which
is basically not very useful today.

BUT, if you are maintaining dozens of the same piece of equipment, the
dynasweep can still be useful. You take nominal measurements on a known
good piece of equipment and then compare with the bad one.

It also could be a useful production line test device, though of course
in the modern ATE era there are faster ways of doing that.

Thanks for the info.
I think I found the actual problem, however. There was a bad soldering job
on the mike plug. when i correct that, I'll see if that's all that's
needed. The 12 volt lamp may have been replaced; it's working fine at
present.

Typically, can ham-bands-only receivers such as the Drake R4 and Collins 75A or 75S series, transmitters such as the Collins 32S and Drake T4 series, and transceivers such as Drake TR-4 and Collins KWM-2, be modified to work on CAP and MARS frequencies?

I know that some radios have provisions for installing crystals so that they'll work on off-band frequencies.

How can I determine which radios are modifiable that way, and also where is a good place to get crystals these days?

Many will reach the CAP and MARS frequencies at the edges of the
dial.

You can usually make small frequency shifts through modification,
but most ham receivers of the boat anchor class used very frugal
mixing schemes that carefully placed major spurious responses outside
of the ham bands.

Operation around the VFO frequency, or the first IF frequency will usually
not be very nice.

Crystals are readily available from Jan, or ICM. Google is your friend.

I think many ham rigs do not meet the new CAP frequency tolerance requirements. If you are planning on using the rig on CAP, make sure the rig is specifically listed as acceptable.

CAP and MARS frequencies were (I don't know if it's the case now) generally
chosen to be adjacent to ham bands so ham equipment could be used. There's
little sense of having an auxiliary if the operators have to buy
extra equipment or the organization has to do so.

Remember, they date from before the new fangled equipment came along.
Transmitters were easy, just pop in a suitable crystal and the rest of
the unit would have enough leeway to tune the adjacent frequency. Receivers
were more of a problem, since retuning generally meant retuning the
local oscillator, there weren't always crystals to select the range. But
a receiver that had a bit of overlap was usually okay.

Hence, most equipment would be modifiable, if there wasn't enough overlap.

From your first post, I thought "167" is what a lot of their power
transformers started with. The catalog I have from about 1972 doesn't
even list any "1670's".

You'll be disappointed though.

I see no straight 167Q.

But, there is a 167Q5, which is 5v at 6amps. There is a 167Q6, which
is 6.3v at 6amps. There is a 167Q12, 12.6v at 13.6 amps. And there is a
167Q14, which is 14v at 6amps.

Obviously the "Q" must denote 6amps, at the number following the "Q" is
the voltage.

It's no wonder the number seemed familiar. I have some in the basement.
The large secondary windings are the giveaway.

No, it's not a Huntron Tracker type device. It's a subber for various sections in a TV set. It was designed for tube TVs and may or may not be useable with solid state ones.

I worked on Hazeltine and Lear Siegler CRT terminals in a shop that did them by the thousands. We had a subber assembly that would do the same things we built. It worked great. When the company was bought out they trashed it-didn't just throw it away, they sledged it and shredded all the documentation. I still have a set of prints I squirreled away somewhere. Management told it was because we were beating the contract labor rate by such a wide margin that if someone ratted us out, the customer would demand a rate reduction.

Months later they fired several people for reasons that made no sense. One of them also, I know, had a set of prints. He must have ratted them out because we lost the contract, and management simply folded the business. The rumor was they were going to demand we sledgehammer all the test equipment, which made little sense to me, but the facility was burgled a short time later and everything not nailed down and some things that were were cleaned out. I saw various pieces of this at hamfests in the area for quite a while after that.

The Huntron Tracker was and is a very efficient piece of troubleshooting for solid state equipment. They made a huge fortune because they had a patent and enforced it. I think the patent has run out but they are still doing pretty well. It's a very simple thing to build. The limiting factor on it is that no one troubleshoots most solid state equipment today-they throw it out still working.

Collins S-Line (which includes KWM-2) is not strictly "ham band only"
in the normal sense of the word. There are 15 or 30 selectable crystal
positions which give a 200 kHz swing in the ranges of 3.4-5.0 and
6.5-30.0 MHz.

It's possible to use an external frequency reference to hit a "dead
nuts on" transmit frequency but for normal use you only have to be
within a designated band limit. There was a crystal accessory
originally intended for Novice ham use when they were rockbound.

Use a counter or service monitor to check your transmit frequency if
you are worried, but I doubt MARS or CAP is going to care if you are
1 khz or less off. Come to think of it, what are CAP's HF allocaions
anyway?

The USS Hornet Amateur Radio Station has aquired several Harris RF-287 Remote Control boxes. I
believe these were used by US Navy Ships for remote speaker-handset stations. I don't know what
type of transceivers they were used with. I haven't found any information about them by googling.
I am looking for a schematic. The box is about 4in. high by 6 in. wide by 4 in. deep and contains a
speaker, audio ower amplifier, power supply regulator, two relays, two small audio transformers, a
switch and a volume control. Connection to the transceiver or patch panel is through a 10 pin MS
connector. Does anyone have a schematic they can share before I have to trace it out? Thanks and
73.

The older equipment referenced, T4/R4, Collins KWM, Collins S-line do not require any 'modification' to reach the CAP/MARS frequencies. I used the Drake T4XC/R4C for years, 1970 through 1985, at AFF1C/AFB1JX/AFW1MCE and I used the KWM-2A at AGA5HI in the 70s. All that is required is the proper mixing crystal.

This class of equipment, however, does not meet the frequency accuracy requirements so external frequency measuring equipment or a FYMON station was required to assure accuracy. The output tuned L/C circuits have a minor impact on the efficiency of the final amplifier. Finally, this class of equipment will NOT OPERATE in selected frequency ranges around the radio's i.f. frequencies.

More modern equipment can be modified to operate on CAP/MARS. Check the various use groups for specifics. I have 'opened-up' my IC-746 and IC-706MKIIg without any problems.

The Collins CP-1 crystal pack provided general coverage HF operation
for the S/Line and KWM-2 equipment. A listing of available
operating frequencies is here:
http://www.collinsradio.org/html/s-line_accessories.html

Where can I buy EI laminations for a 100 Watt transformer. I need to
re-wind a couple
of secondary windings on an existing transformer. I don't think I can
remove the existing
laminations without destroying them :-(

If you look at the list of compliant radios for CAP
https://ntc.cap.af.mil/comm/ you will see that there is almost nothing
in the way of amateur radio equipment that would be useable for CAP.

De laminating a power transformer is usually pretty easy... That is, as long as they haven't run a weld bead along the side to prevent buzzing.

What you do if first knock out the wooden wedge that holds the lamination stack firmly in the center of the cardboard bobbin. Then you take a thick(not flexible), sharp, putty knife, and force it under the tongue of the first lamination that was under the wedge. The varnish will snap easily. Next, force it under the top, or bottom leg of the same lamination "E", and move the putty knife around the full circumference of the "E".

Keep the knife blade flat against the lamination to minimize any bending. They all should peel off pretty easily.

Peter Dahl Co may actually be willing to sell you something... they have
helped me out with parts like that in the past when I have needed them,
and I cannot thank them enough.

But I bet you can get the existing laminations apart with a little hammering
and a little hot water. Once you get one out, they all come apart nicely.

Well my transformer doesn't have a wooden wedge. It has a plastic bobbin
and the
laminations are tight in the bobbin. Also the laminations were
apparently dipped in
varnish as they were assembled. I finally managed to free two of the I
laminations

using the knife trick, but there is no room for the knife between the E laminations.

I have another transformer that is the same size, so maybe I can make one out of two.
I would rather start with a new core though. I want to salvage as much of the winding
as possible but the core would have to be destroyed. Oh yes the transformer has to fit
in the original space and the original mounting holes.

Never had any "NASTY" laminations. Why add to the price of a rewind with new laminations? I rewind transformers everyday that people send me. No need to make any, no time to do it.

I cannot imagine anyone working with slimy varnished laminations. The usual trick is to vacuum impregnate the whole tranny with varnish. They put the tranny in a pot of varnish, and draw a vacuum. The vacuum draws out any air between the laminations, and windings. When they release the vacuum, the varnish is sucked in to fill the vacuous areas.

You should be able to force a sharp blade under the top most "E" lamination on the free corner. It doesn't hurt the lamination to warp it a bit. The varnish will be very brittle, and has little tensile strength.

There is a dead band that is not usable on these, 5 to 6.5 MHz. Also
you need a lot of xtals. Even with the expansion board you can only
have if I remember 30 of them.

There were external VFOs that provided all the possible frequencies
for both the xtal osc and the VFO. A Jaapanese company made one. I
think a service monitor will do as well if the output level is high
enough, most have programmable frequencies like scanners. I think if
the weight and size weren't prohibitive the IFR 1500 would be ideal
because it's available cheap and because it has full duplex unlike the
more common 1200/500 series. You could of course just use a sig gen,
again, assuming the level is high enough. No where in the Collins
manuals is the drive level needed specified!

I'm suirprised a digital internal VFO hasn't been devised for S-Line.

Get a good one and take it to your local print shop and ask them to do a
positive kodalith copy for you. Should cost five or ten bucks. Hurry up,
before the entire process becomes computerized and litho film becomes a
thing of the past.

My understanding of the difference is that the round emblem appeared when Rockwell acquired Collins Radio. Therefore, the winged emblem was used when it was Art Collins &Co. and the round one was used for the later products produced as a part of Rockwell.

If someone has a different understanding, I would be eager to learn about it.

I was actually being sarcastic at RapidRonnie. 8-)>

On the other paw, if you can get Kodalith in 70mm double perf then the
R210 owners of the world will beat a path to your door. (Even the NOS
replacement filmstrips have gone brittle with age and crack when you
try to install them (so I'm told). A great shame, since it's a very
good set (matches the C11 or C13 sender).)

Chris.

From URL:

Apparently -- age when they were made

For what it is worth see The evolution of the Collins emblem URL:

http://k9ham.cargodog.net/collins.htm

Sez:

The first Collins trademark, used in 1933, was a globe with lines of
longitude and latitude and two long, slim wings extending from it. The idea
was submitted by a Cedar Rapids firm for a letterhead on the first company
stationary.

The following year, the same idea reappeared with the grids removed, the
globe enlarged and shaded, and wings shortened.

By the 1960's, the Collins name was prominently displayed in a redesigned
trademark which replaced the wings with straight lines, now referred to as
the "winged emblem" in the ads.

In 1961, a new trademark was produced by Ken Parkhurst & Associates of Los
Angeles. The symbol was patterned after widening circles caused by dropping
a pebble into a pond. However, hams referred to this emblem as the rather
undignfied "meatball" reference.

After the acquisition of Collins by Rockwell International in 1973, the Collins divisions adopted the trademark of the parent corporation. During the transition, S/Line equipment and M-2 as seen in a 1975 brochure did not have an emblem at all.

For more information on the Round Emblem transition, please see the 1998 March/April issue of the Collins Journal.

And for further research -- it sez: For more information on the Round Emblem transition, please see the 1998 March/April issue of the Collins Journal.

No, but I got a bunch of Tri-X in 70mm with Type I and Type II perfs here.
Might have something higher contrast too. How long is the strip? You
ought to be able to contact-print it if it's not too long.

70mm Type I is still very popular for aerial photography. I don't know how
much longer that will continue, though.

If the filmstrips are brittle, you might consider using Filmguard on them.
It is very good at softening up old acetate films; I have had 35mm prints
that were stored in attics and could not be projected which, after being
soaked in filmguard and left for six months, softened up nicely.

As long as Maurer 70mm cameras are available. Wish mine hadn't got
trashed in a move; it was _cool_.

I just checked the compliant CAP list of commercial HF gear. Neither Collins, Drake, Icom, Ten-Tec or Kenwood had any amateur equipment that were on the compliant list. The only ham rig I could find that was on the complaint list was a special version of the 817, and then it had to be operated under 5 watts and it was not compliant on vhf.

The use of a compliant list means that if you are using a non-compliant unit and use elaborate equipment to monitor the frequency to the nerest tenth of a Hz, you are still non-compliant. In short, there is nothing you can do to make it compliant.

It is similar on Search and Rescue frequencies. Althoughamateur vhf equipment can be modified to operate on Search and Rescue, it is not type certified and therefore illegal. In our state, it is the local sheriff who holds the license - so any violation reflects upon the sheriff. We do not allow our local SAR members to operate modified ham gear on the SAR frequencies.

From: Smokey <nospamtelegrapher@hotmail.com>
Message-ID: <1348sa73oitgda7@corp.supernews.com>
Source record: 7860

Am looking for a BFO coil for the Hallicrafters SX-25.
If anyone has a parts radio and can spare the coil I would be interested in buying it. I am refurbishing an SX-25 and have tried to repair the worn inner core of the tuning slug but there is just too much play for it to be stable anymore. Also am looking for the 10 K-ohm potentiometer with the on/off switch configured at the full cloclwise (as viewed from front) rotation for replacement of my RF gain control.

Fair Radiuo offers a generic BFO coil but it is too large (3.3 x 1.5 inches) to fit in the available space.

Thanks.

I think the DM-32A was the designated dynamotor for the BC-453. The design output was 250 volts at .05 amps with 28 volts input. In conversions, the DM-32 could be used for powering it, as it had 12 volts input and the same output.

Source record: 7870

Millions of CRT PC monitors are being disposed of and substituted with flat LCD monitors.

Those old <boatanchor> monitors contain A LOT of hard-to-find components:

- high voltage transistors and FETs (e.g. 1500V, 15 A)
- high-power fast-recovery and Shottky diodes
- high voltage electrolytics and capacitors
- high power resistors
- large ferrite beads and toroids
- inductors of all possible kinds
- beautiful heat sinks
- line filters
- integrated circuits
- etc. etc.

Typically, you will find two boards, a main board and a smaller board which is directly connected to the CRT socket. Both are valuable.

You may get CRT monitors for a few bucks or even for free (e.g. my company is getting rid of all CRT monitors and the boards can be easily removed before disposal).

For quick components extraction you will need a powerful soldering iron, at least 100W.

I wonder whether anyone would could help me understanding the rationale behind a strange inductor I found in many of those boards. It is wound on an (apparently) ferrite core, say one inch long and half inch diameter. The strange thing is that the core is magnetized, so it attracts any piece of iron close to it. What can the reason be to use a magnetized core?

Don't forget, the CC-AWA Spring Swap Meet is NEXT Saturday.

May 19th at the North Carolina Transportation Museum,
"Spencer Shops" in Spencer NC.

Details including driving direction are here,
http://cc_awa.homestead.com/Spring.html

This year there's something extra, there will be an
Antique Truck show at the museum the same time
we are there.

We're asking folks to bring something nice to show
since there will be a lot of non radio people there.
We'll set aside a table under the picnic shelter for the
display radios.

Just a reminder, these events start early, around 7 or 8 am,
and are all done usually before 12 noon.

As always, admission is FREE. Vendor are just $5.

Hope to see you there.

1680. WTD: Photo, measurements of Halli SX-28 dial lock lever

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-14 10:59:37 UTC
From: Dave Goncalves <davegoncalves@gmail.com>
Message-ID: <1179140377.361977.191280@e51g2000hsg.googlegroups.com>
Source record: 7875

Hello,

First, I'd like to thank those who have helped me gather many of the parts needed to put my 'modified' SX-28 back into order. I have nearly everything now.

I have purchased parts for the dial lock, less the lever handle. The lever handle appears to be over an inch long, made of brass, have a flat knurled (texture grooving to help with grip) section at the end, and is threaded and screwed into the compression cam. All I have is photos I took during NEAR-Fest of an SX-28A as a guide. I would like to try and machine a replacement, but I need more information.

Could somebody take a look at their SX-28 or -28A and tell me the following:

1. Is the lever handle screwed into the compression cam? What threading (2-56, 4-40, 6-32) is on the end?

2. What material is the handle made of?

3. Is the knurled section flat on both sides? Or is it rounded on the end?

4. Could somebody take a closeup photo of the handle, separated from the dial lock?

5. Could somebody take measurements of the handle, particularly the length of the knurled section, the shaft section, the threaded section (if it exists) and the diameter of the knurled section and shaft.

I am willing to trade parts for the information.

David Goncalves

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday May 20th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Bob, try searching for this item, you may locate one on an auction
site.
SECO Transistorized TWO WAY RADIO TEST SET CRYSTalignMETER MODEL 500.
It tests all crystals, various sockets, fundalmental, 3rd overtone,
has R.F. Indicator Activity Meter, Signal Generator function with
Modulated & Unmodulated RF, Jacks for Freq Counter connection.
Operates on 2-C cells.
I've been using one the workbench since the the 1960's.

Geoff,
Experienced hams often help out new hams by giving them a good
deal on stuff to get started. That's part of the spirit of the hobby.
I don't know if that's the case or not with your transaction, but if
it is, maybe he just has nostalgic feelings for that particular rig
and regrets having let it go.

I don't think it's amazingly valuable. Maybe $200 US? That guess
comes from a completed listings search on eBay for the FTDX
series. A higher-powered rig sold for a little bit less than that
recently.

Maybe you could let the group know what you paid for it. If he
gave you a good deal, then I think the proper thing to do is let
him have it back for the same price, rather than trying to make a
profit. Chances are, he'll help you find another rig at a good price.

Of course, if you've grown very attached to it, you're not under
any obligation to sell it back to him. But at its best, this hobby is
full of people who help each other out as they can, you know?

73,
Dale

It is a older radio -- and unless you would be willing to repair it in the future -- might be a good time to "sell it back".

Likely has sentimental value to the former owner -- or maybe be bought a radio he does not like (it happens)

1688. Triplett Corporation info

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-15 16:59:18 UTC
From: Edward Knobloch <alias@nowhere.net>
Message-ID: <GFI2i.14268$rT6.13120@trndny08>
Source record: 7882

Hi, Gang

The following was posted to the Test Equipment reflector. I thought it would be of interest to fellow Boatanchorites.

Quote

Of interest to all who own and use Triplett instruments.

As of January 2007 Jewell Instruments, LLC, acquired "certain assets of Triplett Corporation including Triplett Panel Meters, Triplett Analog & Digital Test Equipment, as well as the rights to the Triplett brand name." Jewell already owns Modutec, Emico and A&M Instruments. http://www.jewellinstruments.com/pressrel/Triplett%20Purchase%20Press%20Release.pdf

By the time you read this there is little left of the Triplett Corporation, in business since 1904. Manufacturing in Bluffton, OH, has been closed and moved to Barbados for panel meters and to China for test equipment. The corporate remains will be headquartered at Jewell in New Hampshire. A few Triplett employees will remain in the Engineering Department in Ohio and some others will remain with LFE. LFE/API Instruments was acquired by Triplett in 1997 and is now being spun off again.

Most of the familiar test instruments will be changed in various ways to accommodate being manufactured in China. The 310 compact VOM has been made in China since the first of the year. The case parts and meter movement have been changed and are not compatible with existing units. The 630 and 60 series VOMs are also being changed and various parts will not be backward compatible. Several of the existing model variations have already become unavailable.

It is expected that once parts are gone for existing units of prior U.S. production there will be no more parts support available. It is expected that there will be no parts or service support available for the new production units. They will be exchanged if within warranty and unsupported thereafter.

It is expected that new products will continue to be introduced under the Triplett name. Some will be Triplett designs and some will be re-branded products of other manufacturers. Several new designs have been on hold due to the sale but are likely to continue into production. New products will be produced off-shore. The analog VOM lines will likely be phased out as demand reduces.

The future of the considerable number of manuals available on Triplett's web site is uncertain. There were hundreds more manuals available, both

early and late, which had not yet been posted. Their future availability has not been established. Jewell now controls the site and it is presently unknown if they will continue to provide support for this information. Triplett has a long tradition of providing excellent support, including copies or electronic files of technical data at little or usually no cost.

I consider this information to be as accurate as possible given that the company's situation has changed rapidly and drastically. It is from an unimpeachable source and is presented with permission. I have no fiscal interest in Triplett or Jewell.

The profit SOARS. That's a shame because it means your retirement account SOARS, your IRA SOARS, your 401k SOARS, etc. We really have to watch that profit stuff, it's too good for us.

Corporations are groups of people, my IRA, my 401k, my retirement plan, who invest our money in corporations in the expectation that they will make profits. Profits increase the value of equity [stock shares] and the amount of money you can draw on when you retire. If profits are not made then your IRA, 401K, etc go bankrupt and you will never retire.

Be careful of that profit stuff. It may be too good for you!

Tell me, how do you fund your 401K when you work for McDonalds
flipping burgers?

The biggest result of moving all of our manufacturing jobs to
China/India/??? is the loss of good paying jobs here in the USA.

But I've also read that the variuos 'command' receivers (BC453, 454
etc,) will work well with much lower B+ voltages.
Which are much kinder on the 60 year old decoupling capacitors etc.
can't remember the value but could it have been as low as 120 volts
DC?
Cos it occurs to me that one could use a 150 volt gas regulator tube
(OD3?) on the output of a power supply to achieve that?

Your retirement planning is YOUR RESPONSIBILITY! It is NOT the responsibility of government. It is NOT the responsibility of your employer. It is NOT the responsibility of your union. The responsibility is Yours alone!

If you don't like McDonalds then start your own business, work your butt off, put in 60, 70 or 80 hours a week, and retire a millionaire. If you choose

McDonalds then plan your retirement on welfare, but don't blame McDonalds ... you made the decision to work there in a kids job.

If you don't like McDonalds then get a skill such as a CDL for example. I have a son doing $1800+ a week driving 4 1/2 days a week. He quit high school at 17 and now owns a $300,000 home, has 7 kids, and is home 2 1/2 to 3 days a week.

Where and how you choose to work is your personal gold mine, not a sweat shop or a salt mine. Choose a mine with a piece of the mother lode, as opposed to fools gold [AKA McDonalds]. A major contributor to financial success is your personal ATTITUDE.

You are the only person responsible for your life style as you reach the mature years. Accept the responsibility.

An interesting observation: All of your Senators and Congressmen are heavily invested in the Equity Market [stock market]. Don't you wonder why? As corporate profits go up, their net worth goes up!

I suspect you can easily invest $10 a week ... give up 3 packs of ciga---buts, or 2 six packs ... or a $10 lottery ticket. A simple $10 equity investment in a conservative mutual fund will produce more than $60,000 in 30 years. Invest 2 hours pay a week and the same fund will yield almost $250,000 in 30 years. Factor in pay increases [inflation] and it is easy to have a $1,000,000 fund to convert to an annuity at retirement.

I opened this with the following: "Your retirement planning is YOUR RESPONSIBILITY! It is NOT the responsibility of government. It is NOT the responsibility of your employer. It is NOT the responsibility of your union. The responsibility is Yours alone!" It is true!

I can't say that I've seen that applied to Command sets specifically,
but it's not an unknown concept.

IN 1970, there was a two-part article by Fred Brown about updating an
HRO receiver. He replaced the full size tubes with more modern
equivalents, did some other changes, and ran it at a lower voltage than
originally. He gave all kinds of reasons for the lower plate voltage,
and mentioned that the Collins S-line receiver used lower plate voltage.

I think it was that article where he said the only disadvantage was lower
audio output.

I should think a Master of Science degree in Electrical Engineering should
be enough "skills training". But when you can hire an excellent
EE in India for less than $10/hour USD, where would that leave me?

I have already taken that responsibility.

It is NOT the
> responsibility of government. It is NOT the responsibility of your
> employer. It is NOT the responsibility of your union. The responsibility
> is Yours alone!

You are missing a vital point: You need to be able to earn a living.
As we are sending good, high paying, jobs out of country, we are creating
a large base of people who are underemployed, or out of work. I know

EE's who haven't worked in their field in more than 10 years. Yeah, they have found something else to do, but have lost their homes, and any semblance of the decent lifestyle they once had. They did everything right, went to college, got a good job, worked hard, and poof! an AT&T, or Xerox closes a division and sends the work overseas, and they are out on the streets. Too old to be hired as an EE, and too far in debt to "retire".

> If you don't like McDonalds then start your own business, work your butt
> off, put in 60, 70 or 80 hours a week, and retire a millionaire.

A million bucks doesn't go very far anymore. Inflation makes it go less far every day. I have been running my own business for the last 25 years. It isn't a magic bullet. It requires customers. When your customers find they can go to India, or Bulgaria, or China and get the same work done for 1/10th the domestic price they leave in flocks.

If you

And he will be out of luck when Congress decides to allow Mexican trucks and truckers to drive on US highways... poof! All of the sudden, that monster mound of debt that he has taken on will ruin his life. Besides, what kind of a life is it where you have to be away from your wife and kids 5 days per week? He is literally dumping all the hard stuff about child rearing on his wife... 7 kids without relief? I predict a divorce.

I am already heavily invested in the stock market. And it is doing quite well, but what about the guys that don't have enough money or life left to play? And volatility! I have lost hundreds of thousands of dollars in a day... it comes back, but it always takes a long, long time to recover.

> I suspect you can easily invest $10 a week ... give up 3 packs of
> ciga---buts, or 2 six packs ... or a $10 lottery ticket.

I don't smoke, play the lottery, rarely eat out, don't have cable,
don't go to the movies, drink very little. I suppose I could find
an extra $10/week by not eating, or bathing. But I doubt I can find
the extra years it would take to allow that to accumulate. Nope, one
of those good EE jobs that went to India would be necessary.

A simple $10

It is the responsibility of my government not to destroy the economics
of this country. They are doing so by allowing illegal immigrants to
flood through the borders, and by allowing American companies to export
good high quality jobs without tax implication.

You might be able to do a shunt regulator, since the current demands are small. Be more reliable to use a solid-state series regulator made with a zener diode string and a TIP50 darlington. You could use an OD3 and a 6L6, though, I think.

But, since you're going to be running the things on AC house current anyway rather than on the original dynamotors in most installations, it would be easier just to use an inexpensive 120V isolation transformer driving a bridge rectifier and a pi filter as your power supply. Cheaper to build than a high voltage supply and you get 168V out of it minus the loss in the filter choke.

>to work on CAP and MARS frequencies?

The KWM-2 was designed as a wideband radio and can cover most of the HF
bands. They were sold to many government agencies and the ham market was
a small part of the total sales. The ham models are only lacking the
full crystal board to be used across the band.

I believe the TR-4 was also originally intended to cover the full HF bands
and the ham version is only lacking some minor options.

>How can I determine which radios are modifiable that way, and also where

By reading the service manuals. ICM is a good source for crystals and
are fine folks to deal with.

I would be unwilling to trust electrolytics pulled out of monitors,
but they usually have a lot of nice film capacitors in there too.

Agreed. They are great parts goldmines for anyone building homebrew radio
gear.

>can the reason be to use a magnetized core?

I can think of two reasons: first of all the core could be deliberately
magnetized because it has an asymmetric waveform going through it and needs
to handle big pulses in one direction without saturating, but doesn't need
to be able to handle them in the other. The other possibility is that it
had excessive asymmetry on it and magnetized the core inadvertently.

1706. WTB T1 IF Transformer for a Hammarlund HQ170

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-16 15:33:17 UTC
From: Mark <w8fsa@arrl.net>
Message-ID: <1179329597.273123.130760@l77g2000hsb.googlegroups.com>
Source record: 7801

I'm attempting to restore a Hammarlund HQ170 receiver for a ham friend
of mine. I discovered through
an initial inspection that the 455KHz section of IF transformer T1 is
burned open. T1 is a combined
3035 KHz and 455 KHz transformer. I have checked local sources for a
spare replacement part to no
avail. If anyone out there in this newsgroup has a replacement
transformer they are willing to sell
please respond to my email address. The Hammarlund factory part number
is M26402-2 There is
a very remote chance of repairing this transformer. In order to do
this I will need to know the equivalent
parallel capacitace value of the 455 KHz section. The value is not
given in the schematic diagram.
Thanks in advance for any and all assistance.

1707. Hammarlund HQ-120-X

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-16 16:00:11 UTC
From: jh.graves@verizon.net

I recall that at the HAMfest at Birmingham (AL) several years ago
(possibly as many as 15) some chap had a BC-348 that he had converted to
solid state. All of the tubes had been replaced by transistors - and it
worked pretty well - at least there in the Jefferson Convention Center.

I've thought about trying the same with one of the arc5 receivers - just
never got around to it. Dave Stinson would probably be one to ask about
such a project - Dave- got your ears on?

best regards...

Back in the 1950s, we ran the ARC-5 receivers on AC-DC transformerless power supplies from 115 VAC.
I think you had to change the filaments to series and use a 35w4 rectifier. Also had to be careful
to plug into the AC so that the Neutral connected to the chassis. The B+ would be about 155 VDC.
Not Safe!

The same i.f. pair is used in the HQ-145 455KHz/3035 KHz.

That opens another possible source for replacement.

/s/ DD

Recently restored a HQ-145.

Hank Cross, W1OOP, had an article in Ham Radio magazine in 1969 about
converting one to solid state. It's always interesting how that sort
of conversion went, becuase different people had different philosophy.
Some try to make universal type solid state "tubes". Others build
modules that fit the specific tube socket, but don't tamper with the
existing circuitry. Others, made modules but did do some fiddling
with the existing values.

Hank Cross's philosophy was to basically treat it as a chassis
with coils and capacitors, and hence wasn't stuck with trying to retro
fit solid state devices. It was a mixture of mosfets, bipolar transistors
and ICs. Of course, he also used the opportunity to add some things
he felt missing, like an FM detector (he did a lot of VHF work) and
I think he even made it double conversion.

Is there any obvious choice in 6BY6 vs 6BE6 in a product detector?

I've subbed one for the other in replacement uses and there wasn't any hugely obvious differences, but maybe if someone told me what to look for... :-)

Some skill. New England Tractor Trailer pumps out drivers by the gross.
Very few
earn anywhere's near 1800+ a week.

> An interesting observation: All of your Senators and Congressmen are

All of your senators have vested retirements (18,000 a month) after serving
one term.
They have vested health care, and most had inherited wealth to begin with.
Do you wonder why they are in the market (they can afford to be, you're
paying the tab) and the rich always get richer at the expense of a
lessening middle class...

You've been listening to Limbaugh for too many years. Most kids starting out can barely afford to pay their bills, let alone invest money in a 401K or IRA.
Most folks don't have 30 years in front of them. Baby boomers never had 401Ks or IRAs when they started off.

If the jobs continual to be outsourced, and if the trade deficit continues, and if
foreign scab labor is allowed to bid against union scale you're going to find
your savings will have very little buying power when the worth of the dollar crashes on the world market. Government is the one who is giving away and borrowing from social security and allowing the raping of this country.

The 6BY6 was intended as a sync separator, and to run with 10V on the plate
at that voltage. My bet is the 6BE6 would be the better tube to use unless
your PD is running at reduced plate voltage.

Can the 6BY6 be used as a converter? The whole thing about the 6BE6 is
that changes in control grid voltage don't affect the cathode current much.
If you're doing the self-excited oscillator trick, I think you need the
6BE6.

The 6BE6 has a transconductance, as an oscillator, of 7250 umhos while the 6BY6
has a transconductance of 1900 umhos, as a Class A amplifier.

Different critters designed for different purposes. Each will work in the
other's circuit, but at reduced performance.

You can compare their specifications here:
<http://www.pmillett.com/tubedata/HB-3/Receiving_Tubes_Part_1/6BE6.PDF>

Well Uncle Peter, we both know that it is impossible to live on Social
[in]Security. That's a given.

Since you are responsible for your retirement, not government nor business, what do you propose?

The world economy envisioned by Adam Smith and Thomas Paine in the late 1700s is now here. Business will do whatever is necessary to survive and be profitable in a very competitive world wide economy. Businesses will succeed and fail. Government can't stop it! Again I ask, "What do you propose?"

My proposal is to do whatever is necessary to start building personal equity. In other words, "Get on the equity train before it is out of sight!" You may ride in the caboose as opposed to the dining car, but, you're not left in the station.

What country do you live in?

"Congress: Rank-and-File Members' Salary
The current salary (2006) for rank-and-file members of the House and Senate is
$165,200 per year....

Congress: Benefits

....Members of Congress receive retirement and health benefits under the same
plans available to other federal employees. They become vested after five years
of full participation.

Members elected since 1984 are covered by the Federal Employees' Retirement
System (FERS). Those elected prior to 1984 were covered by the Civil Service
Retirement System (CSRS). In 1984 all members were given the option of remaining
with CSRS or switching to FERS.

As it is for all other federal employees, congressional retirement is funded
through taxes and the participants' contributions. Members of Congress under
FERS contribute 1.3 percent of their salary into the FERS retirement plan and
pay 6.2 percent of their salary in Social Security taxes....

The amount of a Congressperson's pension depends on the years of service and the
average of the highest 3 years of his or her salary. By law, the starting amount
of a Member's retirement annuity may not exceed 80% of his or her final salary.

According to the Congressional Research Service, 413 retired Members of Congress
were receiving federal pensions based fully or in part on their congressional
service as of Oct. 1, 2006. Of this number, 290 had retired under CSRS and were
receiving an average annual pension of $60,972. A total of 123 Members had
retired with service under both CSRS and FERS or with service under FERS only.
Their average annual pension was $35,952 in 2006."

Got any more bullshit you'd like to share?

REDACTED: Waking up is NOT a proposal!! State a credible plan that people can participate in that will provide credible cash flow in retirement.

You have added another variable into the discussion by opening the healthcare issue. Where does the money come from? Don't give the old canard of 'tax the rich'. According to Hillary any family earning more than $30,000 has to be defined as rich to support her health care proposals [healthcare in the USA costs about 10,000 per family per year. According to the USA Census Bureau we have 300,000,+ people at 4.3 people per family or approximately 70,000,000 families. Do the math! [$700 Billion per year!] [note for the non USA reader: $30,000 USD is top of the poor class or bottom of the middle class by contemporary definitions]

Again: Where do you propose the money comes from?

Stating a problem without proposing several possible credible solutions is unacceptable to everyone. Why? We cannot continue to discuss or debate the pros and cons of nothing!

Apparently you have issues with the Equity solution. Fine! I have a problem with NO proposed solution.

Finally, like you, my retirement is also secure, an insured fully funded annuity.

I don't know about Hammarlund dials but I flattened some
Hallicrafters dials by heating them in hot water and then
pressing them between two flat surfaces. I had to cut a
hole in the middle to clear the bushing. be careful and
test an inconspicuous spot on the dial to make sure the
water doesn't dissolve the printing!

> Again: Where do you propose the money comes from?

Gee Dave, did you ever think that if we had DECENT paying jobs in this
country that folks could actually afford health insurance; or companies
could continue to afford offering good health plans? I'll state it again.
Keep American dollars in the US; and do so by balancing the trade
deficit for starters.
Instead of allowing high paying jobs to bleed off to third world countries
(with scant child labor protection laws or environmental laws on the books)
maybe we need some stronger trade protection in place to protect
average Americans' interests instead of corporate greed. Don't you find a
bit
disconcerting that we have gone from being the bread basket of the world
to importing contaminated goods from China? What do you think your
retirement is going to be worth in ten years if the current trade deficit
continues?

What do you propose to do about health care? Taxation obviously isn't the
answer to any problem. I say the answer is keeping jobs in America and
paying a decent wage for American workers will in turn make group health
care affordable. My healthcare is almost 100% covered, my penion is
Federally managed, and my company is earning record products and our
stock price is going through the ceiling. We're also a 100% American
operation.

For use in a product detector, is there an obvious "better choice"
between the 6BE6 and the 6BY6?

The 6BE6 seems more common and looks like it'd be better for use with
AGC applied, but that's not how my product detector works, so I don't
know if there's something else which is a determining factor.

The 6BY6 seems to have originally been intended as a sync separator
for TV use.

Tim.

I think we could go a long ways towards fixing the problem by
doing the following:

1) Close the boarders to illegal immigration.
2) Make it illegal to hire illegal immigrants.
3) Tax American businesses that manufacture abroad as if they
were foreign businesses.
4) Tax software that is done in other countries as if it were
an import of a hard good.
5) Eliminate the H1B Visa program. We have plenty of out-of-work
hitech workers here already that just want to be paid fairly.

-Chuck

And we should charge tariffs accordly based on how those countries
treat our exported products.

I need a few HF rigs this weekend at Dayton.
Looking for quick cash for your solid state HF rig or Shortwave radios or
possibly other amateur radio equipment stop by spaces: 2148-2150
Thank you in advance.

Hi Paul:

It was common in the thirties to test your own tube - without a tube tester. Simply get an old radio book from the thirties and read about it.

You can breadboard a tube tester using a lot of jumpers and meters. I have tested tubes such as the 811 and 211 using basic equipment. Fire up the filament. Get some plate voltage (how about a 9 volt battery?) A microammeter to measure plate current is also needed. Also, helpful to have a variable voltage for the grid, to monitor changes in plate current with changes in grid voltage.

A diode ring mixer from Mini-Circuits?

Seriously, in the later publications that I have the move had started to
balanced mixers -- I would investigate using a twin triode, or get one
of those evil dual-plate steered beam devices (apparently they're
susceptible to stray magnetic fields).

F/B is fair on 20 meters. It gets about 15 dB. [~3-5 % of energy in rear lobe]

It is Good to VG on 17 through 10 respectively. It looks like 20 to 25 dB on 10 meters.

That being said, all measurements are called into question because the S meter is not accurately calibrated, because I'm not at a controlled antenna range, because the signal source being compared is a variable based on propagation, etc.

Finally, after a significant 'wet' snow fall or ice storm the longer elements looks like a 7 weight fly rod with a 7 pound trout attached. It is VERY flexible!! [It quickly de-ices with a little sun though :-)]

It has survived 70 to 80 mph wind and heavy ice loads. I would buy another one!

In my case there's no desire for using the tube as an oscillator.

I was just doing a survey of my radios yesterday and the number of
6BE6's stuck in sockets labeled 6BY6 was astonishing :-).

Some discussions in the ham literature indicate that the 6BY6 is less
prone to overload.

If any of the cans you have have a combined 455 KHz and 3035 KHz plus
a link coupling
coil in one unit it may work for me. I beleive the 'M' in the part
number means the transformer
has mutually linked coupling to another similer type of transformer.
Unfortunately, I don't
have the downloaded manuals on the HQ-100 or HQ-110 receivers and
can't verify if
they have what I'm looking for. IF transformer T1 was a part in the
HQ-170 that was
subject to a high failure rate. I'm attempting to find out if there
were any factory service
bulletins issued that addressed the failure problem. Thanks for your
help and the
previous poster on the HQ-145 info.

Colin-

Back in the 50s I used a low frequency ARC-5 receiver (BC-453?) to tune
the 455 KHz IF of a National SW-54, making it a double-conversion
receiver.

The dynamotor had a 28 volt field winding that consisted of two sections
in series. It was common to reconnect them in parallel, and operate off
of 12 volts. However, that produced half the HV output. If there was
more to the mod that gave the full 250 Volts, I never came across it.

> full crystal board to be used across the band.

As I said:

Collins S-Line (which includes KWM-2) is not strictly "ham band only"
in the normal sense of the word. There are 15 or 30 selectable crystal
positions which give a 200 kHz swing in the ranges of 3.4-5.0 and
6.5-30.0 MHz.

In other words, you do not have all the HF ham allocations, because
you have no 160 meters. You also do not have the new 60 meter
allocations, specific 5332-5405 channels.

S-Line gear made with the single crystal deck may be upgraded to the
dual deck configuration. You still only get 30, 200 kHz snippets.
That's a total of 6000 kHz or 6 MHz total coverage. The 32S-x
transmitter and KWM may be run with an external mixing source, such as
a signal generator or VFO. The receivers can also with some minor
mods. This is not my definition of "general coverage".

Additionally, you do not have true CW transmit except on the later
S-3 transmitter, and you do not have AM transmit on the KWM-2 or the
32S unless modified. Even then, it's not full plate modulation.

S-Line Collins is (as Bret puts it) "JFK/MM era stylish" and
reasonably well built but is not a mil-spec box.

I'm not at all familiar with Drake but I know they are well liked and
apparently in modified form are the choice of hardcore contesters,
over Collins or true comm/mil gear.

Hopefully you will die before the house of cards collapses....

I don't say that to be mean: the notion that we can outsource to
China and have it made for nothing while profiting from it forever is
nuts. The Chinese are going to either sell the tech to all comers at
just over cost and disintermediate you, or they will keep the quality
of yore and raise their price to you, disintermediating you.

Like Harry Mudd, you will get tired of hearing the "d" word.

The Chinese do not need our "service' and "knowledge workers" to make
50- or 5- year old technology. In fact they can natively build
microprocessors two generations-i.e. 36 months-behind ours. Our only
advantage on an absolute basis is the leading edge, and in having an

aerospace level supply chain with melt-to-ship traceability.

When they have that, they will dump the dollar and implode your precious 401K and tech stock holdings. It will ruin them in dollar terms, BUT THEY DON"T CARE. What are we going to do, repossess their houses? Ruin their credit ratings? Refuse them future check cashing services?

It's not as if they are a family living in St. Louis or Seattle who could be put out on the street. They own their street, their houses, and have a military to keep it so. The rules of consumer credit do not apply to sovereign nations with effective militaries.

> a very competitive world wide economy. Businesses will succeed and fail.
> Government can't stop it! Again I ask, "What do you propose?"

What government must do is make absolute arbitrage of labor
expensive.

Chinese labor is cheap because, in addition to being low skilled, not
speaking English, and not being terribly imbued with a sense of
precision workmanship, it is artificially suppressed by its own
government, for the advantage of its ruling class. Also, there are no
environmental protection, worker safety, product liability or other
such issues it presents or concern it. A company taking designs and
procedures invented here with people trained and educated at American
societal expense and building it over there is simply doing what most
very successful enterprises-from Ford Motor Company to Microsoft to
the Mafia-have done to make huge amounts of money. They have
privatized the profits and commonized the costs of doing business.

There is an extent to which that's a necessary cost for societal
progress, and an extent to which it is nothing more than outright
destruction of the social fabric. What started as "constructive
engagement" of China has reached that point because it makes a few
people-the CEO's of major corporations, certain politicians, and stock
speculators-insanely wealthy at the expense of everyone else.

If you have enough money and enough balls and can speculate in stock
successfully and get out of the market before it finally blows up,
putting your assets in physical commodities such as gold in your
defensible posession, you stand to be one of the Big Winners. But it's
like a casino: if the house didn't have the odds, there would be no
house. We can no more all do this than we can all take our life
savings and go to Vegas and gamble ourselves rich for life. A few can
succeed: most will be bankrupt and the casinos will make a lot of
money. For MOST people the stock market is a casino, no more, and no
less.

Yes, it would, which is why it won't happen.

1747. OT: "An Open Letter to Rush"

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-17 23:32:39 UTC
From: RapidRonnie <rapidronnie@cbgb.net>

Source record: 7844

I was shooting the shit with a friend the other day about building a downconverter board for old tube receivers-I was thinking Collins but any would do-to give them BCB and other off-ham reception without permanent butchering. We were talking about how there is nothing on AM anymore besides Limblow and he gave me this letter his dad wrote to Rush. He got no response.

He has let me post it. I don't have a scanner so I'm going to type it in and any flaws are probably mine.

"Dear Mr. Limbaugh:

I am a 59 year old white male who is alive today only because of the kindness of strangers and my religious beliefs against suicide. I have no assets, no marketable skills and can not do heavy manual labor even if someone would let me. I work part time at a job that I honestly hate but which I am grateful for nevertheless.

Perhaps I should be regarded as a derelict, but if I am a derelict or a bum, my path to that status has ben an unusual one. I have a master's degree in electrical engineering and over 30 years experience at everything from digital interfacing and assembler programming to maintaining radar and broadcast transmitters. There are no jobs within a 50 mile radius of my house (or, should I say, what was my house) that will hire me for any electronic or electrical job. No matter what the stated requirements, I'm always underqualified, overqualified, lack the necessary experience or certification, or some other nebulous reason. The real issue is that there are now many more people in every facet of electronics than there are jobs.

Most of the jobs have gone to China or india, but the ones still in the US have gone to areas like the San Francisco Bay Area and have left the Midwest and South. This is because they can hire H-1B applicants there for very low wages.

While employed in industry, I saved money carefully and raised two children with my wife of 32 years. A year after the last employer I worked for massively downsized, she was diagnosed with cancer and died. We had little insurance and although she did receive what I think was the best possible treatment, we had to refinance the house and the bills destroyed any other equity we would have had many times over. I am making payments on the house but with the liens I will never see any net equity in it again. In essence, I am renting the house from the bank. If I miss two payments I will be on the street.

I have gone as low as to apply to work at burger places but my age and the fact I don't speak Spanish are serious issues baring me from a management trainee position. Office temporary places have got me a couple of call center positions, but they have not worked out well long term. I was doing technical support for an Internet provider, after acquiring A+ and Microsoft Certified Professional certifications with money from the sale of my late father's Lionel trains and his L.C. Smith shotgun-may G-d forgive me!-but I was fired after responding to a barrage of profanity from a snotnosed teenager in a less than deferential manner. As a result of that the temp agency that placed me won't talk to me anymore.

Start my own business, is that what I should do, Mr. Limbaugh? What business would you propose? No, that is not an option for me. In fact, let's get something out of the way. Small business is not the economic engine of America, and it never was. American prosperity is built on medium and large corporations, and has been since the 1880s. Most startups, then and now, fail, as you are well aware.

Perhaps I should become a doctor, a lawyer, a CPA? Medicine, dentistry and pharmacy are out of the question at my age: I've checked. I couldn't even get into veterinary school. Law school is an option, if I were to take on a $80,000 debt over and above the one I have, but let's be honest: what firm worth talking to is going to hire a 62-year-old new bar admittee? I'd wind up working as a law clerk or tax preparer and defaulting my debt. There is nothing they could do about it: my house is already far in lien and I drive ten year old cars. Despite my math and engineering background, becoming a CPA would mean even more college than law school (though perhaps cheaper).

Trade school? I've looked into truck driving, but the only job you get out of school is driving for a "truck load carrier", living in a sleeper cab and being out for weeks at a time. Auto mechanics? I'm already a decent car mechanic, actually, but I'm not fast, and I'd never survive in a dealership. And again no one would hire me. I've made a few enquiries. I couldn't even get hired in a parts store, because-get this-I had "no experience". Never mind I could explain the function of every part in the store and look up any needed piece of information in their database. The manager admitted he simply was not allowed to hire anyone over 35 unless they had management level experience with a competing chain, and besides, I'd better be prepared to win a fistfight or two with the young counterpeople on staff or they'd harass me to death in two weeks anyway. Oh yes, and do it without anyone else seeing it. If he saw it, he'd have to fire us both, and he didn't want to lose any of his young hard chargers. (I guess I should be grateful he told me the truth straight up instead of giving me a long runaround.) I even looked into aircraft mechanic school, but aside from the insane tuition, I managed to find out that all the jobs available are in places like Florida, Arizona, and Nevada-hard, hot outdoor work.
And starting pay, after spending $30,000, is about $14 an hour.

No, Mr. Limbaugh, the problem isn't that I am lazy or stupid or criminal. The problem is that I did just what conservatives are supposed to do-worked hard, went to school, married and had a family. I did it in a world where alleged "conservatives" have stabbed me, and others like me, in the back. They have deported our industry and allowed unskilled, not very bright, and incorrigibly non-American workers to flood the lower rungs of the labor market and foreign college graduates willing to become virtual indentured servants to kill the technical professions for their own profit.

Is this your definition of "moral responsibility", Mr. Limbaugh? "Family values"? If not, I think you owe me, and the millions in my situation an explanation. If they are indeed your values, then you owe it to us to at least own up to it. And we owe it to you and to ourselves to get your old, fat carcass off the radio. "

There are a number of things that can be considered when using a tube as a mixer. I always thought the 6BE6 was more prone to microphonics than other tubes. That does not show up in the tube manuals.

It is certainly possible that the 6BY6 may handle higher signal levels as a mixer, even though not designed as one. Probably the best test is with a signal generator and in the actual radio.

Anyone worked on Racal MA 1723 HF exciter synth board ?

If you know the set, you will know the board ....

I can only get the varactor control line voltage up to 13 V , that's
2
V short of the
spec in the handbook ..

But by reducing L17 , you can get the synth to lock at 29.9999 with
a line voltage of 13.2 V .. ae output signal is on freq and
stable ..

Is this a fault or was it not allways possible to reach 15 v on a
'older' synth board ?

Tnx - G ..

In the famous HBR receiver design by sk W6TC, the product detector was a
6BE6 in the original circuit, but he later changed it to use the 6BY6
claiming that it gave better performance with less cross modulation and
overload.

The college has been using this receiver for a number of years as an "introduction to radios that used to glow in the dark" for the new members of the campus ham club. The campus is "going green" and we are putting this venerable old boatanchor up for grabs so that we can afford to get a solid state rig that will run from a 12 volt battery and solar photoelectrics.

Take a shot or two at Charlie Nudo (66-catalina) while you're at it.

Latest Nudo News: One of his spamming accounts,
"elkhound68@yahoo.com," was banned by Google Groups effective two days
ago for "commercial spam." One down, four to go.

Hallicrafters used a 6BY6 product detector
in their highly regarded SX-115 receiver.
Interestingly, they included a 3.3 ohm 1 Watt series resistor
in the 6.3V heater supply for that tube.

Source record: 7911

Hi - looking for a main tuning(the largest size) knob and clamp for a 390 rx. One of mine has a broken clamp and now has broken shaft "huggers" on the inside of the knob itself. Cosmetic condition is not at all important because I have the pending task of painting most of two sets ahead of me anyway. 73, dave austerman

1766. Free: NC HRO

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-20 00:42:06 UTC
From: Alan Westhagen <news@westhagen.com>
Message-ID: <f2o5h0$6jh$1@gnus01.u.washington.edu>
Source record: 7912

I was a ham when I was a kid in the 1950s. I still have the receiver that I used and would like to give it to someone who likes antique communications receivers. It is a NC HRO (possible an AR-7 -- I can't remember). I will give it away for the price of shipping.

It has a gray, baked enamel case; vernier dial, three coil assemblies. The glass in the meter is cracked. There is also a separate power supply.

It hasn't been used for about 50 years, but has been in storage during that time.

Sounds like an HRO-7. The later HRO-50 and 60 had
slide-rule dials in addition to the famous multiple-turn HRO
dial, earlier ones are painted black.
I would love to have this thing but I am too far away to
come and get it.
There is an on line free manual for the HRO-7 on the BAMA
site.
A full set of coils to cover the HF and amateur bands
would consist of four dual range coils (general coverage and
ham band) and a 15 meter band band spread coil. Someone who
is willing to do a lot of work can make a very good receiver
of this.

I have looked at pictures of the HRO-7 on the web. I think that mine
may be a bit older. It has the cool tuning knob, but the front of
the
case is completely flat, and the finish is baked rather than shiny.

There is a pretty good set of pictures at
http://www.io.com/~nielw/nat_list/nat_list.htm
The HRO-7 is gray and the coils have linear scales on them instead of
charts. The earlier models look pretty much alike although there were
variations. The last of the black boxes was the 5a (I think) which had
a built in noise limiter giving it an additional knob on the front.
Most of the HRO's I've seen had wrinkle finish paint but some probably
had smooth finish. National built a lot of these guys both for hams
and the military. They were also used quite a bit for commercial use.
I expect this thing would be too much trouble and too expensive to
ship but I am sore tempted:-)

I would. The title of the newsgroup is not

rec.radio.amateur.political.statements.

It *is*

rec.radio.amateur.boatanchors.

Oh, and *plink* -- which is like *PLONK*, but scaled to fit the
offender.

No. "OT" is just an excuse by idiots to post whatever junk they
see fit.

There are plenty of newsgroups where the poster could post this on-topic,
but he chose to post here where it was off-topic. Putting "OT" in
the subject header does not make it any more on-topic, it just gives
the veneer of looking like the poster is being thoughtful, if you don't
look closely. The reality is the poster doesn't care about the newsgroup,
he just wants to jam his off-topic message down our throats.

I'm sick and tired of people's concept of newsgroups as a hang out,
where the purpose of the newsgroup isn't particularly relevant but
hanging out with people and posting all kinds of unrelated posts is
"okay". I keep leaving newsgroups that I've bene reading and posting to for
a decade as idiots like the original poster in this thread think it's
okay to post off-topic junk, so eventually there is pretty much no
on-topic posts in a given newsgroup.

I see it as very much like parking in a 'No Parking' zone with your emergency flashers turned on. The flashers should be saying, "This vehicle is disabled." The message received is, "The driver is too lazy to park where he/she is should and, thinks that turning the flashers on makes it OK."

OK, firstly, you "this isn't on topic for boatanchors" self-righteous,
net-police, you miss the point.

Yes, this thread is stoopid in that it blames Limbaugh or immigration
policies or whatever. It's just as stoopid to say that the original
post is off-topic.

This is boatanchors, old radios which are probably cared for by old
men most of whom share some of RapidRonnie's friend's life issues.
Even if you don't think you do, you do. Obsolete, lost pensions,
limited job opportunities, the world is passing you by.

The problem is that the world is passing you by. You gotta run fast
and smart to keep up.

Masters in electrical engineering? Assembler programming? 30 years of digital circuitry? Can't get a job? What's THAT about?

I'll tell you what it's about. It's about being a little too set on specifics and closed to opportunities. That's what happens when you get old.

Yes, the design bureaus have moved to India and China along with manufacturing and support. The fact is, the U.S. and people here can still earn a living.

I see two different paths for the author.

1) become the U.S. end, engineering rep, of a Chinese or Indian operation. I don't know how to break into that but I do know that Chinese design is pitiful, we can do better. They need a presence here, that can be you.

2) take enough "shop" to work as an electrician. With a years experience on top of an M.S. EE, you should be bidding on jobs as a subcontractor and in a couple years, running an electrical contracting business.

By the way, my Masters/Computer Science is from an engineering school, part of a top tier university. I had a hard time for a few years but seem to have found a niche.

-kh ... it's been tough.

I don't care about the political crap, BUT you could build a nice downconverter with a single 6BE6... I am not sure you could get good performance out of a block downconverter, though, because of the IMD issues. The best overall performance might be to have a tunable downconverter with the receiver tuned to a fixed IF frequency. This also, of course, means the downconverter front end can be allowed to drift a little and doesn't need to be crystallized like with a block converter.

There were a lot of block converter projects out there, though, mostly intended to allow ham reception on BCB receivers rather than the other way around.

I _think_ I may have a vintage vibrator-style static inverter that will
allow you to run the HQ-100 off a 12 volt battery and solar photoelectrics.
I'll have to go hunting for it, but it certainly would make for an unusual
alternative-energy station.

Don't forget broadcast engineering. You'll need to learn some computer skills to handle a lot of the newer studio and automation systems, but there is a severe shortage of people that know the RF side of the house in the broadcast industry. And there is hardly ANYONE left that knows how to build and maintain AM directional arrays any more. Modern network analyzers have turned directional array phasing networks from a cut and try affair to a comparatively simple plug and chug operation, but nobody seems to want to learn it.

Broadcast engineers don't get paid enormous amounts, but the pay isn't bad and the work is fun. You may or may not have to deal with lots of after hours calls depending on your customers....

I do not know the set. However, I have a 1255 HF transceiver synth unit sitting here that needs to be repaired and I'd love someone who is more familiar with the technology to peek at it for me. Some previous tech appears to have butchered some things in the process of trying to fix it. It does not lock up and from the look of it someone has attempted to swap chips in the divider chain.

If it is like the 1255, the varactor voltage is controlled by a charge pump that involves some tantalum caps. I would check the caps for leakage before doing anything else. If you crank L17 down and the thing will lock at 29.9, does it ALSO lock stably at the bottom of the range?

If it's like the 1255, it should actually go down to some outrageously low frequency and stay locked.

You don't hardly need anyone. The entire array can be designed using the program the FCC provides for that purpose. A couple of engineers can easily handle all of the AM needs for the entire US... and I know a half dozen that are currently very lightly loaded.

We need industry!

Ok Scott,

Well , since the post ive had a few other things go on it as well ,
new fault every time i powered it up .even one of the chips that drive
the led's on the front panel failed .. took a while to realise the
function was still working and the lamp had died .. ..
however ....after a few new bits ... so far so good ....

The lock voltage has risen slightly upto about 13.6 max now after a 48 hour run , then it refused to lock when cold .. finally after 'exercising' the chips on the synth board in there holders ..locks at switch on ..and holds down past 100 khz ..as it ground equipment , everything is plugged in .. if it was airborne would be 100 p/c soldered

dont know if i'm really going to get the extra volt by fitting new caps .. full out of lock is 14 v .

. fed it some audio the other day and it actually sounds quite good .. there are a set of control lines , that feed the amp, one named 'tx' i have found closed to ground on tx, so thats a handy feed for the tx/ rx ae switch, next step air test , be about 25 watts from the linea drive drive amp so should do ok .. cannot mute the rx , so have to use a short agc

G ..

1794. WTD: 'Parts' SX-28 S-Meter

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-22 01:56:55 UTC
From: Dave Goncalves <davegoncalves@gmail.com>
Message-ID: <1179799015.279674.71170@n59g2000hsh.googlegroups.com>
Source record: 7940

I've got many parts to build a SX-28 meter, except for the movement and back mounting plate. Anybody got a junky SX-28 meter to sell? Don't need look-alikes, already have some - I'm a nut for original parts...

The difference here is that the SX-28 meter is lit in the center of the dial, rather then on the top. The movement is mounted to the back plate on the edge, rather than on the bottom. Other, more common meters are lit from the top, as the big meter magnet takes all of the room in the center.

Will buy and trade. Might somebody have on in their junk bin?

Thanks,

David Goncalves

Unusual, yes. To the point, no. The idea is to communicate effectively and efficiently at the same time. Spending solar power to heat up the shack isn't where we are coming from. But thanks anyway.

Yes, we do but that industry is not going to come back. I know a guy who thought he could retire to fixing TV and consumer electronics. About 10 years ago, he started buying TV repair equipment, parts, tubes, books. In 1960 a 25 inch color TV cost half as much as a car. Today, it's almost a stock stuffer, except it's 30 inches, HD, and made in China. No one fixes this stuff anymore.

I thought I might be able to liquidate my 1960's HF radios for some real money. They are still worth something but not enough to live on. My S-1, S-Line with the 30L-1 and 312B-4 won't bring $3,000. That's with three 75S-1 receivers and the crystal pack. Not much walking around money when a fill-up is $90 at the Exxon.

I've done what I can, paid it forward so to speak. Several outfits catering to Hams seem to be widows selling off the last projects of a talented engineer. I don't know if this is a fact but there are these troubling signs... The Radio Adventures BK-175 QSK kit, the S&S Engineering DVFO-II. I've bought these and others. There's a story on the other end of the transaction.

I've been lucky. I did have an "incident" with idiots a few years ago. They wanted me to do my job AND do it their way. It doesn't work that way. I have an M.S. Computer Science and 35 years building software. An ex-pilot and an army ranger does not tell me how to build production software, I don't care how many brochures you guys read. They booted me out and I had to take a job at twice the salary. Took 3 hours to find it.

Life can be tough. Even worse, they bugged me monthly for the next year, "say, how, er, how do we, like, you know, the Unix server...."

Sorry, my time is booked. Good luck to you.

I can be flip about it but I know that if things had been slightly different, I'd be where RapidRonnie's friend is.

35 years ago, at the dawn of time, I went into computer software rather than electrical engineering. The result of that one decision is that I KNOW how to build production code, better, faster, cleaner. It takes about 6 months to retool to a new environment, S/360 MFT, MVS, TSO, VM/CMS, VMS, Unix, MS-DOS, OS/2, Win32, Linux, assembler,

EXCP, PL/I, C, C++, Java, SQL, XML, any language, any environment, it's just logic and bit streams and knowing how to aggregate and manipulate it.

I use paradigms that I learned at great cost in 1970 today. It was a lot of hard work but I did NOT work any harder than the EEs or MEs, I was lucky. I don't know if my luck will hold.

Software is moving overseas, India mostly. I don't know how many years I have left.

It's been a good run.

Why don't you do it blubber boy?

For the folks that get confused when I post from different computers:

KE4ODD, Tracy Fort, Beerbarrel and whatever the hell else you want to call me are all the same person!....ME!

1803. FS Ham IV Rotator

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-23 17:42:57 UTC
From: Charlie Hugg <k5mbx@sbcglobal.net>
Message-ID: <q2%4i.6162$4Y.2687@newssvr19.news.prodigy.net>
Source record: 7749

I have for sale a nice hy-gain Ham IV Rotator and Control Box. This unit was completely rebuilt in the late 1990s and then never used. It has been stored indoors and looks almost new.
The Control box is the newer black one like is used with the Ham IV currently being sold for $559. I hooked it up and run it through its paces and it works great. Included is the
original manual. Price is $259 plus shipping from 79602. Thanks, Charlie Hugg, K5MBX

1804. FS MFJ 259 Antenna Analyzer

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-23 17:58:31 UTC

Source record: 7750

I have for sale a MFJ 259 Antenna Analyzer. It looks and operates as new.
Price is $185 plus shipping from 79602.
Thanks, Charlie Hugg, K5MBX

1805. FS: E F Johnson 116-285-1 Vernier Knob New in the Box!!!

Newsgroup: rec.radio.amateur.boatanchors

From: Michael Crestohl <W1RC@notmyrealaddress.net>
Message-ID: <oo0953dtpk1j7n9ega3ed8ieng1haur36k@4ax.com>
Source record: 7751

Hi Gang:

Yes, that's right - an E F Johnson 116-285-1 Vernier Knob new
in the box! Probably not many of these around anymore.

I'd like to get $20.00 for it plus postage. Any takers?

If interested please reply by e-mail.

73,

Michael,

W1RC*at*verizon*dot*net

1806. FS: GE Console Loudspeaker

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-23 18:08:52 UTC
From: Michael Crestohl <W1RC@notmyrealaddress.net>
Message-ID: <3p09539a0v8thklklp86ld1oqs0avj7eqc@4ax.com>
Source record: 7752

Hi Gang:

This is a nice old G.E. loudspeaker. case is heavy metal and measures 6-1/2" by 6-1/2". My guess is that it came from a communications console in some fire or police department from the 1950s.

I'd like to get $10.00 for it plus postage. Any takers?

If interested please reply by e-mail.

73,

Michael,

W1RC*at*verizon*dot*net

1807. FS: Cover and AC Power Cord for AN/USM 159A Frequency Mter

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-23 18:21:24 UTC
From: Michael Crestohl <W1RC@notmyrealaddress.net>
Message-ID: <bg1953l0uelqalsftncaf2d5fgdtj4qk3r@4ax.com>
Source record: 7753

Hi Gang:

I found this in the basement and don't need it because I don't have this piece of equipment. I can't even recall how I came to have it. If you have one of these freq meters (with the cool film strip readout) missing the cover here's your chance to pick it up. It is in very clean condition; paintwork is excellent with a couple of die-size abrasions on the front. Rubber sealing gasket is excellent. The AC line cord is also there but the plug is missing. I'm asking $10.00 plus postage for it; any takers? Please reply by e-mail.

Tnx es 73,

Michael, W1RC

I've a question. If these tubes would make your rig "sound loud" but
not actually amplify the power which they won't, why are there so many
people responding like they don't know what they're talking about?
Oh sorry, the new Ham generation, codeless geeks.

Regardless of your "extra," you are a classless ham.

> Oh sorry, the new Ham generation, codeless geeks.

Licensing requirements have changed many times through the years. Recently
the big change is to remove the code requirement. So what? It doesn't mean
new licensees CAN'T or won't use CW, which is all none of your business.

You should enjoy your privileges and let others with different privileges
enjoy theirs. You were not given any ARRL or FCC sniping privileges with
that Extra.

Because he isn't selling tubes, he is selling sweep tube linear amplifiers
for use with CB radios.

Even someone with an Extra Class License should understand the
implications of that.

Remarkable,

A dual triode with a max plate dissipation of 1.5 watts.

How did this spawn all the remarks from radio police?
Rhetorical question, don't answer.

> Think 6GF5 and a typo?

It is a good question, though. From the advertisement,
it is implied that what is being sold is an "enhancement"
for your CB radio.

If it is simply a NIB 6GF7 tube, then all of the supposed
benefits are meaningless, as a 6GF7 is a dissimilar section
twin triode that was made for use as a vertical deflection
amplifier in TV sets. A 6GF7 might have been applicable
in an old tube model CB, but old tube model CB radios are
pretty rare these days.

Perhaps it is a knee jerk reaction to the poster, and the
word CB? Doug Adair, or someone purporting to be Doug
Adair, seems to have a big interest in buying, selling and
using CB linears.

1830. Need FL-2100B Plate Current Meter

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-25 16:33:40 UTC
From: Charlie Hugg <k5mbx@sbcglobal.net>
Message-ID: <AdE5i.4010$C96.3944@newssvr23.news.prodigy.net>
Source record: 7776

I am in need of a Plate Current/SWR Meter for the FL-2100B amplifier.
It is the one with the red portion on the front of the meter face.
I also need the shunt to the Plate Current/SWR meter.
It is identified as R3 on the schematic and is a wired wound on ceremic
capacitor by passed with a .01 disc ceremic capacitor.
It is mounted on the bottom of the powere Supply filter Board
If you have either of these parts, please let me know.
Thanks, Charlie Hugg, K5MBX

That's really an ignorant post. If you are one of the guys selling CB amps.
I hope they get you sooner than later.

I see from a recent eBay email, that they are working to make it easier to
catch people running scams or otherwise breaking laws such as those intended
to stop CB Amp sales.

10-4 good buddy.

1846. WTT NIB Trunking Scanners for Analog SW Receivers

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-26 19:52:16 UTC
From: Tom Montgomery <montgomeryt@cinci.rr.com>
Message-ID: <46588fe5$0$4678$4c368faf@roadrunner.com>
Source record: 7792

I have new in box the following:

Pro 94 scanner Dual Trunking

Pro 97 Scanner Triple Trunking

Pro 528 Scanner Triple Trunking

These scanners have never been out of the box. I would like to trade for analog SW receivers. All offers will be considered.

Looking for Yaesu FRG 7, any Hallicrafters, Allied, Lafayette, Realistic 160's, Zenith Transoceanics, etc. Let me know what you have to offer and we can talk. If you have any sitting around and they are in good working condition contact me. Not looking for any fixer uppers.

Will sell these scanners if I have to, but I love to trade and would like this to be first option.

Thanks,
Tom

<dutyhonorcountry2@hotmail.com> wrote:

>http://cgi.ebay<snip>

This spammer, Charlie Nudo, says rules don't apply to him and spams Usenet unrepentently for his own eBay trash and for businesses he cons into paying him to spam their wares. He uses four different sock puppet names to spam with to evade Google's posting limit for each account. So far, Google has shut down 20 of his other sock puppets, so let's finish the job. All his spam posts originate from frontier.net, his home ISP, and since he's dumb enough to use Google Groups, his IP is in each header.

Such eBay auction spam is a violation of both eBay's and Google's Terms of Service. Fight back against Usenet spam by sending his spam message, with headers, to:

groups-abuse@google.com
abuse@frontiernet.net
spam@ebay.com
abuse@ebay.com

Google Groupers, click "More Options", then "Report This Post," then "This Post is Spam" and send.

UPDATE: Thanks to many peoples' reponse to his last spam barrage, Google Groups has banned "elkhound"<elkhound68@yahoo.com> as of three days ago for this spamming. It was a "warning shot" across his leaky bow. Keep the spam reports coming in, and all four other ones will soon be gone as well.

LATEST: Now, to attempt to avoid Google's abuse desk, he posts and immediately deletes the posts. Too bad for him we can still see them.

Ho humm, so tired of that comment. I think you need some new
material. Why would I as an Extra Class Licensee have to know that?
It wasn't on my FCC exam. Oh shxt, there I go again, now I sound like
a new codeless clone.

NOPE!!

Just commenting and suggesting 'Free Advertising'.

1854. FS Kenwood TS-530S HF Transceiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-28 03:27:25 UTC
From: Charlie Hugg <k5mbx@sbcglobal.net>
Message-ID: <x_r6i.23819$JZ3.4250@newssvr13.news.prodigy.net>
Source record: 7700

FS Kenwood TS-530S HF Transceiver. This one is in nice condition and operates as it should. It has one small ding on the back left side of the cabinet, but it is hardly visibly. The Front Panel is excellent and all of the dial lights work and the display is clear and bright. It has the optional Kenwood 1.8 SSB Filter installed.
It comes with the original manual. Price is $375 plus shipping from 79602.
Thanks, Charlie Hugg, K5MBX

1855. FA: Pristine, probably unused mil multimeter TS-352B/U with manuals, probes, blue bakelite face

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-28 05:59:55 UTC
From: William Noble <nobody@nowhere.com>
Message-ID: <465a63b0$0$16290$88260bb3@free.teranews.com>
Source record: 7701

this is a very sought after mil multimeter (VOM) in absolutely pristine condition - and it has a blue bakelite face - I've never seen that on a mil meter before. I suppose it's blue for Air Force. Manuals are dated 1953 - details in the auction:
here's the link
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=300115813412

I usually don't put a reserve on my auctions, but this one is too nice to let go for a few dollars so it does have a reserve but I think it's low for something that is over 50 years old and is really pristine except for a few scratches on the outside of the case from sitting on a shelf all these years.

1857. Schematic for a receiver module...

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-05-28 16:28:28 UTC
From: Randy or Sherry Guttery <comcents@bellsouth.net>
Message-ID: <qlD6i.15621$px2.5752@bignews4.bellsouth.net>
Source record: 7703

I'm looking for a schematic (or preferably user / service manual) for a TX/NF-105 module (tuning head) for my Empire (Singer / Metrics) NF-105. The TX module receives the 14Khz to 150Khz range. I have the the manual on the base unit and the TA, T1, T2 & T3 modules (combined they cover 150Khz to 1000Mhz); and would like to complete "the set". I've looked at all the usual places - Ford is out of business, and the only other place that listed one - has a typo (their book is for the TA, not the TX).

Would like to buy a copy; or I'll pay postage both ways if someone would loan me a copy so I could copy it.

Thanks!

Classic James Millen antenna pre-amplifier. It's in great original condition and works just fine. It comes with 3 coil sets, one 13-15 mc, 27-32 mc and 48-55 mc.

Note: Mating Connectors included.

I will send photos upon request - Bob WB2ICQ

$75.00 includes shipping anywhere in the continental U.S.

Thanks - I've checked that out pretty well. So far I've found one copy - but the guy wants quite a bit for it (within $5 of what he wants for the complete NF-105 manual which includes the other four tuning heads). I'll keep looking. One may show up on ebay yet.

Thanks for the list...

Subject says it all. both in nice shape and working. The only "issue"
is the digital readout is a bit flaky, but will settle down after the
rig has been on a while. Operates on 12vdc and 110vac, full power from
the S2001 finals.
The TV-502 is nice and works , have the correct Kenwood cable to hook
it up.
All manuals power cord and hand mic included. $675.00 FOB 78013
Thanks, George W5GRG

Nope. Not even close.

Start with 6' 3", 190 lbs.......... And try again pig droppings.

1873. HCRA Tailgate Party - June 1st - Feeding Hills, MA

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-06-01 02:14:37 UTC
From: "Jim, KK1W" <jmullen@rockys.com>
Message-ID: <liL7i.1196$D64.770@newsfe06.lga>
Source record: 7719

Friday, June 1st, is HCRA's annual Tail Gate Party at the Feeding Hills Congregation Church (the same place as the meetings).

Here are the details:

HCRA Tail Gate Party (and hamfest)

Location: Feeding Hills Congregational Church
21 North Westfield St.
Feeding Hills, MA 01030

Time: 6:30 PM

Cost: $5/tail gate spot for sellers
Free for buyers

There will be a club donation table for HCRA and MTARA at the event, as well as popcorn, coffee & donuts, soda and of course... A good time!

The weather promises to be good so don't miss out on some free fun this weekend. Tell you friends, it is not necessary to be a member of HCRA to come to the party or attend the meeting.

Don't want to pay for a spot but have a few items to 'unload'? Then bring them around to the club donation table and let your donation go to help out your favorite club. We thank you in advance for your generosity.

More info and a map at: http://www.hcra.org

See you tomorrow evening,

Jim, KK1W

National NC-173 = Sams Photofact 40-13

National HFS = Sams Photofact 62-14

Maybe someone on the group has them? Sams still has the original
Photofacts listed as availible on their database.

I just came in from taking pictures, and counting. Seems like I had
more than what I thought!
Looks like 2595 tubes in boxes and some were not counted as to give a
fair estimate of the quantity.

Price is $1200 cash and carry. That's Less than 50 cents a tube.

I took pictures and can email pics to anyone interested.

If the pictures are too many and they bounce your mailbox I will try
to send just a few pics to show what I have.

These tubes came from the oldest radio and tv shop in the county.

I hate to say it but I thru the ryders manuals away 20 years
ago..........

All the sams photofacts went to the recycle yard last week.........
had sams from 1 to present

Have some test equipment also for sale.

1878. FS Nice Yaesy FT-530S HF Transceiver

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-06-02 15:02:12 UTC
From: Charlie Hugg <k5mbx@sbcglobal.net>
Message-ID: <DDf8i.7712$C96.3379@newssvr23.news.prodigy.net>
Source record: 7724

FS Kenwood TS-530S HF Transceiver. This one is in nice condition and operates as it should. It has one small ding on the edge of the back left side of the
cabinet, but it is hardly visibly. The Front Panel is excellent and all of the dial lights work and the display is clear and bright. It has the optional Kenwood 1.8 SSB Filter installed.
It comes with the original manual. Price is $345 plus shipping from 79602.
Thanks, Charlie Hugg, K5MBX

1879. FS: 5868 4/1250 Amperex

I have an all but out-of-the-box TS-830S (Gold) and accompanying VFO-230 digital VFO in like condition. The '830S has the narrow CW filter installed as well as a KB-1 weighted knob. The system includes the mic and accessory DIN connectors. Also included are the original operations manuals and Kenwood depot maintenance book. All original boxes are in excellent condition, too. Taking to the Manassas VA and Frederick MD fests and/or sell locally in Mid-Atlantic area. $550. An SP-520 speaker is available in like condition for an additional $40. It isn't the "correct" speaker, per se, but it works fine, of course.

I'm looking for a replacement audio output transformer for my Drake 2B receiver.

6AQ5 is the audio output tube, so presumably about 5K primary impedance and 8 ohm secondary, although I'm not picky on these parameters.

What I am picky about is that the transformer mounting holes are on 2" centers. Looking at the AES catalog I see 2.375" centers, and also 1.5" centers, but the 1.5" one sounds really really too dinky.

Any other places I should be looking? Cannibalizing an old AA5? Don't know the impedance parameters of those but they can't be too far off, can they?

Tim.

1887. Technical Materiel Antenna Switch--What plugs in?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-06-03 19:01:36 UTC
From: afcsman <afcsman@hotmail.com>
Message-ID: <HtydncOA_Z6Mjf7bnZ2dnUVZ_hadnZ2d@comcast.com>
Source record: 7733

I just acquired a Technical Materiel Corporation Model SW206 antenna switch with two "N-Type" looking female input jacks, each wired in parallel to an associated SO-239 output jack. Two NC switches link all the jacks together. When one of the "N" jacks has a plug inserted and pushes its white inner insulator, its NC switch opens and isolates the other "N" and SO-239 pair.

Neat concept. Almost like a Bird Coaxwitch. Nice, sealed unit. But what kind of plugs fit the long-sleeved TMC JJ-162 jacks?

I'd appreciate any help from people who have played with TMC equipment.

> K4DII

Back around 1948, in the UK I recall buying a transformer that had 24 volt heater winding instead of 6.3, along with 5 volts for a rectifier heater and centre tapped B+ 250-0-250 winding, specifically for war surplus receiver power supplies. The input was of course 230 volts at 50 cycles. At around age 14 I built a such a power , supply but used selenium rectifiers instead of a 5 volt tube.

It's just occurred that one could, and people probably have done so many times already, use any conventional power transformer? Rewiring the war surplus tube heaters from 24/28 volt to 12 volts, i.e all in parallel. Then connecting them to the 6.3 + 5 = 11.3 volts windings in series. An ARC 5, for example, has six 12 volt 0.15 amp tubes; 6 x 0.15 = 0.9 amps, well within the ampacity of both heater windings. Then using SS diodes for the B+ which even at 250 volts was a maximum of 60 m/a.

Taking all the wattage into consideration, even at 80% efficiency, the consumption and heat dissipation would only be 25 watts or less?

Two similar rules when you are losing an argument:

a) shout louder ... it clearly establishes that you are unreasonable.
b) use the language of the gutter ... it clearly establishes that you are ignorant.

Would appreciate info about this unit. Google yields only one
classified ad from 1946. Model 16 differs from the Deluxe TOM (1940) or
TO-3 in that it has one set of tip jacks for R/C/Megger measurements,
and a "Paper&Mica/Electrolytic" slide switch on the panel above the
Power Factor pot. It seems to work, although calibration is a bit off.
Haven't decided what to do with it, though if it's very rare, maybe sell.

I have just come into possession of a Precision [PACO] E-200-C signal generator S/N 38XXX. Case is a 7+ out of 10. Interior is 9.5+ [GREAT!]

The BAMA site has a manual for S/Ns > 54000 [ca 1957]. The tube line up in the higher S/Ns is 5Y3, 6AU6, 6U8.

The tube line up in S/N 38XXX is 5Y3, 6SN7, 6J5.

Anyone have a source of manual/schematic? I have a strong EE background and could easily trace out what I need. But, a manual/schematic would be nice.

AA5s usually used 50L6s or 50C5s, both of which use 2.5K output transformers. Secondaries usually feeding 3.2 ohm speakers, so you might be able to get by if you use an 8 ohm speaker. However, you will take a significant loss of bass (low audio frequencies). But in a communications radio, that may not be that important.

I could suggest the use of an L shaped metal bracket to mount the transformer to, and to mount to the chassis, but that would look rather ugly. You probably are concerned about the looks of the chassis, so that's not really a viable option.

Are you sure about the 6SN7? The earlier versions used the 6SK7 and
6C5, along with an 80 rectifier which is the 5Y3 with a four pin base.
Take a look at the earlier manual on BAMA and see if someone has put the
wrong tubes in there, or if it is at least closer to what you have.
http://bama.edebris.com/download/paco/e200/PrecE200.pdf

I have several versions of this generator in collection of old test
equipment.

What is wrong with the cord? If it is the neutral and ground
swapped, just replace the plug and wire it properly. There are two
types, with different part numbers, and you haven't said WHAT you
bought.

The three round pin oval cords were used on Victor adding machines,
not sewing machines. HP used one version on older test equipment,
before switcing to the now common IEC power cords. The white and green
wires are swapped between versions. One has the ground on the center
pin, and the other has the neutral on the center.

(I'm afraid this could be not on-topic, but I hope it fits into this newsgroup more or less.)
Tubes wanted, in any quantity and condition. I am looking for gas discharge display-tubes (nixies) as listed above. The tubes I am especially interested in are:

- CD47, GR-414, GR-727, GR-628, GR1620, CD27: giant tubes from Okaya in Japan
- B-7971, B-8971 or other alphanumeric indicator tubes from Burroughs, USA
- Z568M, Z5680: huge tubes from RFT, East Germany.

I am also interested in any other display tubes/nixies. If you possess some, you are more than welcome to offer a price. My email address is found here (anti spam):
www.jb-electronics.de/htm/allgemein/kontakt.htm

Regards,
Jens

Which has mounting centers at 2+13/16" (nearly 3"). Looks like a nice transformer, though, and I'd forgotten that Edcor was still doing them!

Again, my main constraint here is I need a 2" mounting center audio out transformer. Not too picky about impedances etc., but has to fit in the available space!

I'm surprised there isn't a market for this transformer size, because lots of consumer equipment (e.g. AA5's, TV's, small phonos) use 2" mounting center audio out transformers as well as much of my ham equipment. Oh well, maybe I'm destined to cannibalize something after all.

Tim.

Not offhand but if you tell me what the pin configuration is, I might
be able to.

I'm retired and going to be moving across country to smaller quarters and have a lot of stuff that I'd like to take with but reality is reality. I'm not under any pressure to sell and am interested in getting a fair price. I think the best way to get a fair price is to put it on eBay or some other auction. I guess I could have my own. I'm not intersted in low ball offers (and may not respond) or trades unless it's an older US made acoustic guitar by Martin or Taylor or maybe a US made 5 string banjo. This stuff has been in storage for 10 years or so and I won't have the time to do much testing, describing will take enough time. I've fired up few pieces in the last few months and all worked and I know some have problems, but I would say like Fair Radio in Lima, repairable. This is a partial list, more to come as I get into the storage. On most of the stuff I have a fair idea of its hamfest value which is generally lower eBay. I'll structure my eBay posting based on the most requests for a certain piece. email direct to: kolesnik@sbcglobal.netski leave off the ski.

Sell it on eBay and you'll clear five figures easily. If this is what
you've had in storage I'd love to see the equipment you're actually using.

Apologies, I realized that after I posted the Edcor wasn't.

Have you tried guitar reverb driver transformers? They're 25K:8R and fit
tiny mounting holes. Check Triode Electronics maybe?

Some transformer companies will do a run for a collector's group. If
you can drum up enough interest for a group buy of 50, give Phyllis Weston
a shout at Edcor :-)

Cheers!

What I don't want to do is to have to put any new holes into the
already pretty crowded chassis. I could imagine putting a different-
sized transformer underneath on a bracket but there's not an infinite
amount of room. I'll see what I can fit, but most likely I'll order
the AA5 transformer from RadioDaze that others here have mentioned.

Looks of the chassis? The top of the copper plated chassis is corroded
to brown and black. Underneath it's very clean.

Tim.

Subject: Re: An apology from Mike Corley
Date: Wed Sep 27 14:20:36 1995

In referenced article, David Wooding says...
>Well, Mike Corley might or might not have written the apologies, but I
>think not. I thought the following line both witty and imaginative.
>
>>>It was the razor blades stuffed down between the keys that told me.

Corley himself denies posting this "apology", but I'm impressed if it
is a forgery.

Here's the header of my received email. It looks very genuine except
for the fact that postings to newsgroups are directed through demon's
mail to news gateway, which is strange.

Also the message id is <m0sxbx2-000JEeC@bloor.torfree.net> which seems
to be in a different format from previous Corley postings, e.g.
<DFJJB3.6Ft.0.bloor@torfree.net

The mail seems to have been received directly from mail.torfree.net.

One way of telling for sure would be if anyone on the recipient list
contacted torfree, but did not publish any complaints on the newsgroups
- he would not have had access to their address in that case.

1918. FS: E F Johnson 116-285-1 Vernier Knob New in the Box!!!

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-06-08 19:58:22 UTC
From: Michael Crestohl <W1RC@notmyrealaddress.net>
Message-ID: <bi6j639533iqd0r2e5fj6m12d6manlu02b@4ax.com>
Source record: 7664

Hi Gang:

Yes, that's right - an E F Johnson 116-285-1 Vernier Knob new
in the box! Probably not many of these around anymore.

I'd like to get $15.00 for it plus postage. Any takers?

If interested please reply by e-mail.

73,

Michael,

W1RC*at*verizon*dot*net

1919. FS: GE Console Loudspeaker

Newsgroup: rec.radio.amateur.boatanchors

Hi Gang:

This is a nice old G.E. loudspeaker. case is heavy metal and measures 6-1/2" by 6-1/2". My guess is that it came from a communications console in some fire or police department from the 1950s.

I'd like to get $10.00 for it plus postage. Any takers?

If interested please reply by e-mail.

73,

Michael,

Hi Gang:

This is a nice very clean original RCA SC-13 RCA Transistor manual
from 1967. There is no writing inside and there are no missing pages.
In fact I would say that it is in EXTREMELY FINE condition for a 40
year-old book.

I'd like to get $18.00 for it plus postage. Any takers?

If interested please reply by e-mail.

73,

Michael,

This unit may work...An internet friend helped me do some diagnostics
on it an he says it is working but I do not really know how to use it.
Also, the calibration circuit is not working for some reason and I do
not want to try and fix this so I am selling it as is.

IWATSU SS-5702 20MHz 2 CHANNEL OSCILLOSCOPE w/3 Probes
Item number: 260126627132

Have a couple of other items there also..

Do you see "FA" in the newsgroup name anywhere? No? Well, then why the
fuck do you feel it acceptable to SPAM your crap here?

I don't see a problem with someone who is a regular contributor to this NG
occasionally posting something like this.
Look up the definition of spam. This is not spam.

What newsgroup are you talking about? It was cross posted to five
groups, including news:sci.electronics.equipment. When the electronics
newsgroups were created, a specific newsgroup was also created for all
sales in the news:misc groups. For sale postings are not allowed, by
the newsgroup charter for the following groups:

news:sci.electronics.basics

news:sci.electronics.cad

news:sci.electronics.components

news:sci.electronics.design

news:sci.electronics.equipment

news:sci.electronics.misc

Here is a link to the creation of these groups.

The ankle biter is likely from one of the cross posted NG's and not AGA.
Really, it's not that big of a deal. This happens in unmoderated NG's all
the time. There's nothing you can do about it. Live with this or use your
filter. IMHO, he followed the accepted standard, marking it "FA" for which
a filer could so easily be established. This complaint is bogus.

One would wonder if the calibrator or vertical amps were bad without a
better
discription of what was tested. Just an observation.

OK, I didn't notice the cross-posting. I posted my reply from
alt.guitar.amps, where similar postings occur relatively frequently.

I have no problems with that. If news:alt.guitar.amps was created for the porpose or it doesn't say in the group charter and no one complains, make use of it.

There aren't supposed to be any 'for sale' postings in any of the news:sci.* groups. That was why the news:misc.industry.electronics.marketplace group was created. We go through floods of spam, both electronics, and unrelated that make some of the electronics newsgroups almost unusable. That is why we do our best to inform the offenders. Politely, when that works, but some of the guys can get VERY aggressive qwith repeat . We have had a lot of cross posted crap lately, and it seems to keep spreading when the new groups are noticed. If people would use news:misc.industry.electronics.marketplace like it should be, it would be a nice resource. Right now, it gets unrelated crap becasue no one seems to care.

It was his idea for me to get on my knees. Its not my fault that he
didn't read my sig file. I only get on my knees to pray, or shoot! ;-)
I'm in too much pain to do it for ANY other reasons. :(

BTW, I repaired a lot of amps back in the '70s and '80s, till I got
tired of guys that were in a big hurry, then didn't have the money for
months to pay their bills.

ONLY if ALL the groups on the To: line *allow* SPAM. THEY DON'T.

Your knowledge of Usenet history is SERIOUSLY lacking.
Usenet was set up as a DISCUSSION medium.
Those groups that have a need for a place for commercial postings
then set up a sub-heirarchy called *marketplace* or *forsale*.
THOSE are where FA or FS are appropriate.

What drove me to move to Meridian, was HP's DEMAND that old items
were supported, so just call them and ask for help, in this day n age,
PV beats everybody in C/Support. Make the call. Might even be a 800#.

In the late 90's, PV made any schematic available for $3. They even paid
s/h. Today, it might be adjusted for time and space, but I have yet to hear
from anyone who has been DENIED support for products decades older then dirt..

I've seen the halls that make this happen..awesome...

JJTj

I've been a drag racer on LSD,
and I rode bare-assed on top of the shpinx,
I even had a gorilla on the slopes of kismet,
and man, that was fun for a while you bet but...

Bikini girls with machine guns,
Bikini girls with machine guns,
that stuff will kill ya, and it's loaded with fun,
Bikini girls with machine guns

well I savored many foriegn kinds of delicacies,
intoxicated til I can't tell what the hell I could see,
had all the violence and liquor within close reach,
but all bars, pills and threeways lead me back to the beach...

...yeah...

Bikini girls with machine guns,
Bikini girls with machine guns,
that stuff will kill ya, & it's loaded with fun,
Bikini girls with machine guns

now they say that virtue is it's own reward,
but when that surf comes in I'm gunna get my board,
I got my own ideas about the righteous kick,
n you can keep the reward, I'd just as soon stay sick...

1949. Where d'ya find carborundum powder?

Newsgroup: rec.radio.amateur.boatanchors

In the 1960s I ruined many a crystal following the guidelines found in ham publications then for raising the frequency of my FT-243s. Of course I used Comet or Ajax since that was all that was available. Now, lo these many years later I am ready to give it a go again only this time I'd like to try it with carborundum grinding powder. I have checked the local hardware stores and the response is typical for the Jasons and Jareds who have no business working in such a place. When they ask you to repeat "carborundum" its a sign they'll be of little help. I've tried automotive parts stores and, while carborundum is used in cylinder compound it is mixed with some other chemicals I am not sure would be good for my quartz. One idea was the guys that polish rocks and collect them. Hobby stores? So where do YOU find your carborundum? I'd like to know because I can't find it. Even the people at the glass etching place in town thought I was gargling when I said the word "carborundum." Thanks for your suggestions.

Go back to the automotive parts store and pick up some 1500 grit carborundum paper. I use it all the time on the FT-243. Use it with water, works great and works well.

Technique is important, there were many articles that stressed the proper
techniques to grind the crystals to keep the quartz plate surfaces perfectly
parallel. A lot of hams would grind down the edges, which caused a loss
of activity or a dead crystal.

I'm with Pete, I don't think the abrasive matters while how you do it
does.

If you grind too much, that will kill them. And as Pete says, if what
grinding you do is not nice and even over the surface, that will cause
problems.

If you don't clean things properly after the actual grinding, that may
stop oscillation.

1958. FS: Hallicrafters SX-28

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-06-11 12:14:47 UTC
From: JRS <n3ab@fast.net>
Message-ID: <t4fq635iv5p4hjc985ad37vc1u353cgqjj@4ax.com>
Source record: 7604

I have for sale a Hallicrafters SX-28A which I purchased years ago, but never got around to restoring it. This unit has a case and bottom cover. Overall physical condition of this radio is good to very good. All of the knobs look original; the bandswitch knob needs some cleaning. The line cord is brittle and should be replaced. I powered this receiver up through a variac, and it received some stations on the AM broadcast band, and some on the 5.8 to 11 MHz and the 11 to 21 MHz bands. This radio has been in storage for over 10 years, so it probably needs to have its controls/switches cleaned, alignment, etc. One thing not original with this radio is two tube sockets that are mounted inside this unit (see photos). I believe the original owner made this mod for some regulators tubes, but the radio seems to work OK without the tubes. I do have the manual for this radio and it is included.

This radio is heavy and I will not ship it. Buyer will need to either pick it up or I can meet somewhere within a reasonable driving distance of Allentown, PA or Hazleton, PA. This will give the prospective buyer a good chance to carefully check this radio before purchasing.

Pictures of it can be seen at:
http://www.users.fast.net/~n3ab/sx28-1.jpg

http://www.users.fast.net/~n3ab/sx28-2.jpg

http://www.users.fast.net/~n3ab/sx28-3.jpg

Asking $375.00 obo. Cash, money order or cashiers check preferred. Please email me if you have questions. Thanks for reading.

$35 which includes return shipping in CONUS ...add $1 for Paypal.
This assumes all parts are there and not damaged. Otherwise we wil
need to negotiate the damaged items also.

or:

If his meter is complete and isn't damaged he can buy my meter off of
Ebay for the Buy It Now price and I'll give him a credit on his meter
after he sends it to me and I have assembled it, tested it, and sold
it on Ebay for him.
He needs to keep in mind that he might possibly not get all of his
purchase price back after my time and Ebay/Paypal costs is subtracted
from the sale price, but he will get a working, calibrated meter right
now and a good part (if not all or more) of his initial investment
back in a short amount of time after his meter sells. J.P.

I recently overhauled a quite nice RME 45A. All's well with it now, except for the S-meter... its dead open. Seems that B+ was apparently routed across it owing to some defective associated components. I did find another S-meter that works fine but its not quite as vintage. I'm curious if repair is possible and economically feasible and, if so, whom might I contact. Thanks much.

Actually, the "new" meter fits the hole and looks about the same type.
The differences are that the RME has a yellow, logo'd, back-lit scale,
whereas the new meter has a white face. Both have "S" scales. Maybe I
should simply count blessings and press on?

Depends on the tubes . If the two are same type ,you can series
them ,no problem.. If the two tubes draw different current,then you
can use a parallel resistor to equal the current in each tube...Old
radio amateurs handbook is a good source fr this inf... GL W4PQW

Will the old scale fit into the new meter? If its back
illuminated the lamp would have to fit into the case.

I'm an almost tube newbie, but here's what I know of this, in order of
importance:

* the tubes have to draw the same current, else one tube will get too
hot and the other will run cold.

* some tubes take longer to warm up than others. When they started
putting color TV's together with long strings of filaments that added up
to 110V, they also instituted "controlled warm-up" filaments so they'd
all warm up in about the same amount of time. I don't know if this is
such a big deal at 12V.

* If you're doing really low-level audio (or a VFO for that matter), the
filament can "talk" to the cathode a little bit. Running your 6V tubes
from a winding with a center tap will minimize this. Running the
filament slightly positive (I think) to the cathode will suppress issues
of the filament emitting electrons that bias the cathode. Building your
circuits so the cathode goes to a hard ground will significantly
minimize these effects, at the cost of quite a bit of circuit
convenience, although you see it done.

Some meters, particularly the older ones, can be disassembled. In this
case you may be able to swap parts until you have a working one with the
right appearance, and a pile of useless parts that look like they could
be from a meter.

Yep, good ideas and I'll explore the possibility. If the face will
mount on the new meter, I can probably do without the back-lit feature.
Or...if I'm real clever, and the way is clear, I could drill and
grommet bush a lamp into the case. I was able to trick-bag a
hallicrafters meter that way, so maybe this one too? I'll have a look?

A suffix tubes I believe will work in series string (providing the
filament currents are the same that is..).

I have ground 6 MHz crystals up 1 MHz - just to see if I could do it. I grind in a figure 8 pattern using fine sanding paper. I often use 600 grit to speed things along.

I use a small square piece of glass I got from the garbage can of the glass cutter at the local hardware store.

Clean well after grinding.

It took me one NBA basketball game and two cold beers to go up one MHz. If you secure the glass plate, you can grind with one hand and drink with the other.

I now have a large box of ham crystals - even made a nice label for it.

Moyco Precision Abrasives sells it. You should be able to get a small
amount from Barton's And Company, 215-659-6184. They sell to jewelers
and can probably suggest other abrasive compounds for quartz as well.

Cylinder compound WILL work on crystals, as will Ajax Cleanser if you are
very, very patient.

You can, but the tube filaments won't last as long because of the turn-on surge. If it's a circuit where the tubes fail with poor emission long before the filament fails, that's fine.

I don't get it. Maybe I'm a bit thick, but why would the turn-on surge
higher? Provided the filament current is the same for both tubes, I
wouldn't have thought that it would have made any difference. In the
good old days, I'm sure that I have connected up 12AX7/12AU7/12AT7
heaters (12.6V centre-tap) to run off 12.6V (pinout =
anode-grid-cathode-heater-heater-anode-grid cathode-heater CT). Would
the switch-on surge be less if they were run connected for 6.3V?

When you turn it on, the filament resistance is very low, BUT even worse,
the tube is in series with another tube whose resistance is ALSO very low.

Watch a series string device like an AA5 radio or a TV set turn on... the
filaments get VERY bright, then they drop down to normal brightness after
a second or so. There are tubes designed to deal with that, but not all
of them are.

I find LED backlighting an interesting topic in itself. When attempting to replace the burned-out grain-of-wheat lamps in my Kenwood TS-120S with LEDs, I found the dispersion angle such that it didn't illuminate the entire scale -- only a spot in the middle. A friend (service manager for a local pro sound dealer) then mentioned, "just grind or file the lens on the LED, and the dispersion angle will increase a lot". The next time I need to replace lamps, I'll do that.

Also in regard to LED backlighting, I learned that not all white LEDs are created equal. Most emit a bluish-white light, and are rather pricey compared to other colors (even compared to blue LEDs). Just this week, in refitting a ring light for a microscope with white LEDs where I work, I found a pretty good lamp that's handled by Mouser (http://www.mouser.com/). It's called a "warm white" LED, T1 package, and is only $1.00/ea. Search for stock #889-LM560.

Nope. I still don't see the difference between a single 6.3V filament
fed from a 6.3V source, and 2 x 6.3 V filaments in series fed from a
12.6V source.

What you say is true. When you turn it on, the (cold) filament
resistance will be low, and there will be a current surge. What you see
is a heart-stopping bright-up of the filament, before it dims to normal
brightness.

However, you could argue that, with a single filament, it is in series
with nothing, other than the resistance of the transformer. As this will
probably be lower than that of a 12.6V transformer, the surge could be
higher. But this doesn't really hold water either, as you only have 6.3V
driving it.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday June 17th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

The only case where series is a problem is if one of the filaments heats up more quickly than the rest. Because filament resistance is very nonlinear, and changes about 30-to-1 in value from cold to hot, the filament that heats up first will be drastically overloaded for a brief period.

Most modern (if I can use that term) filaments are of the controlled heating variety and should be ok in a series configuration.

-Chuck

Parallel string heaters usually outlast series string heaters, but the
difference isn't due to the heater wiring but due to the surge power from
the heater power supply. Series string tubes are usually powered directly
from the main AC power supply and parallel heaters are almost always powered
through a transformer.

The heater transformer cannot supply a huge surge current.

I spent a day tearing apart a rotor control box and was almost ready to
drop the tower when I discovered that the direction meter was set in
the "calibrate" mode." Do'h!

Hell getting old.

These manuals are usually $5 on down at hamfests.

Unless you can find someone who collects these books-and maybe
someone ought to, but as far as I know no one does-there is no market
for them as a collectible.

You can freely download the RC manuals up until 1962 or thereabouts
from various sites and there is no difference in later ones except for
a few series string oddball TV tubes. The theory is repeated verbatim.
Later ones have a few different sample circuits, mostly tube TV
sections and CB transceivers.

Do you mean you have a complete TV chassis? Or just the pushbutton tuner assembly?

I can't imagine there would be much of a market for the pushbutton tuner assembly, since most chassis will still have the original.

Source record: 7513

I have a nice Collins Winged Emblem KWM2A for sale. It has the factory
plug-in relays. The SN is 16839. It belonged to a friend of mine who
purchased it several years ago. It has not been tested.
The transceiver looks good. The cabinet has the original finish and is
nice. There has been some touch up done on a few spots. The Front Panel
looks good. It has a few scuffs and scratches on it. The Band Switch Knob
has
been put on too tight at some time and a mark has been made in the
plate behind the switch. The chassis looks very clean and all the
controls are tight and don't indicate excessive wear or use. I think
that it probably works, but may need some minor work and a good alignment
It should make a nice transceiver. Asked to see pictures.
It comes with the original manual. Crystals indicate that it was made in
1966, Price is $575;
I have several pictures of the transceiver. If your interested , please
e-mail me for them.
Thanks, Charlie Hugg, K5MBX

2018. Re: Where d'ya find carborundum powder?

Newsgroup: rec.radio.amateur.boatanchors

Source record: 7514

Thanks to all of you for some excellent suggestions and help. Colin, I fell of my chair reading yours ! :)
I realize now that "carborundum powder" is one of those things that ham project books describe but, in reality, was never invented.
Somewhere in a cavernous basement is an evil person laughing about the goose chase he sent legions of novices on only to end in hopeless frustration. His eyes are probably sinister and he has a fang-like overbite. Memories of my first Boy Scout campout come to mind as I recall spending hours in the middle of the night going camp to camp for my scoutmaster trying to find a "caffeine eliminator" for his coffee. Others, I have heard, looked for "snipe." "Caffeine eliminators," "snipe" and now we can add "carborundum powder" to the list of common things that no one will ever be able to find.

ANYWAY...the suggestion of using "anything abrasive will work" was a good one. I had on hand some 1500 grit waterproof sheets of something or other (I don't know if it was aluminum oxide, emery, sandpaper or what). I decided to try grinding again after my 40 year hiatus since my novice days. I dropped a few drops on water on the stuff to give the crystal a little cushioning. 3 sets of "figure 8s" later I had moved the crystal the 2 kc I wanted to move it. It was simple. Light pressure on the corners of the crystal...only enough to guide it in its figure-8 pattern, not even bearing down with any discernable pressure. After each set of 8 figure-8s I'd rinse the crystal off and remeasure its frequency. There was no magic in the event and it was actually somewhat anticlimactic. Apparently technique is the key thing, keeping the crystal parallel and trying not to grind down the corners.

Had I been this successful as a WN9 I may have been launched into a whole different career. Why, I could have been "C-W Crystals" or "Peterson" or "James Knight" !!!

And from my executive office I could have ordered around my employees..."Anderson, bring me the Jenkins report!, " "Wilson, get in here I want to see you" but my favorite would be, "Miss Davis...bring me a cup of coffee, cream and sugar and the caffeine eliminator." Heh-heh.

No problem as long as they take the same current, i.e. 300 ma . If they take
different currents then you have to bridge the one taking less current with
a resistor so that the series current of the highest filament is equal.
Otherwise you'll burn out the filament with the lower current requirement

Carborundum was a man-made product produced in electric fired furnaces
in the New York region IIRC.. I have a few examples ofearly carborundum
fixed
detectors in my collection. Whether the product is still being commercially
produced is another thing, but it did exist at one time...

Carborundum is the abrasive used in any of the "black" sand papers, such as the brand name "wet-or-dry". It is a trade name for silicon carbide.

Originally carborundum was a mined mineral called moissanite. But now it is made using an electric furnace to combine silica sand and carbon. It is such an easy process you could make carborundum crystals at home if you wanted to.

Carborundum was the initial product mined by the company we now know as 3M. Back then the company was known as Minnesota Mining and Manufacturing. They were the first to find a reliable way of putting carefully graded and sized carborundum granules on a piece of waterproof paper. In essence, they invented "sandpaper".

Poppycock!

Carborundum is the 3M trademark for Silicon Carbide. It is very much available,
and is the grit on any of the black sandpapers, such as "Wet-or_Dry".

Less than a minute with google would have found you plenty of information on
the subject, and a few suppliers.

It is still being commercially produced, and like most other materials today,
most of it comes from China. Moyco sells several grades for abrasive.

Most vintage radio resources credit the Carborundum Company, in Niagra
Falls, NY
with the product. Here is a link:

http://www.chemheritage.org/classroom/chemach/electrochem/acheson.html

I'm pretty sure my detector assemblies are labeled as being made by the
same company.

Some further checking revealed:

http://multimedia.mmm.com/mws/mediawebserver.dyn?6666660Zjcf6lVs6EVs666IMhCOrrrrQ-

It would seem that 3M was looking for a carborundum, and found a mine in
3 rivers Minnesota, and thought they were mining carborundum, but were wrong.
In the end, that mistake caused them to go into the sandpaper business using
imported garnet abrasive. The rest is history, as they say.

-Chuck

> the switch-on surge be less if they were run connected for 6.3V?

If the tube filaments that are in series are perfectly matched, then
they both see the same turn-on surges. The two halfs of a 12AU7 are by
definition pretty well matched.

But if they aren't perfectly matched, then one heats up a little
faster than the other, there is an unequal stress applied to the tube
filaments causing extra abuse to the guy who heats up first. The guy
who heats up faster will have more resistance than the others, but the
current through all the filaments is by definition the same, and the
hot one will be dissipating more power than the other cooler guys.

If there is a filament transformer, the impedance of the transformer
will lessen the peak current at turn-on. So will other devices that
serve as inrush limiters.

In real life, while filament failures do occur, they are not the most
common cause of a tube's end-of-life. Just in my experience, low
emission, gassy tubes, and interelement shorts are all far more common
failures of the tube. Not to mention the #1 cause, a leaky coupling
capacitor causing a tube to overheat and fail.

Tim.

FS. Collins 516F-2 Power Supply, needs plug on the cable to connect to KWM-2
or
S-Line. The power supplys looks original. It is in nice shape. The top
choke has a 8-65 date code on it. The caps look original so it may
need to be recapped. The Collins 516F-2 Cabinet is Winged. It has some
dings on the top.
The trim ring is metal and looks good as does the Winged Collins name tag.
The front grill also is nice. Price for the power supply and the cabinet is
$225 plus shipping.
I have several picture of these pieces. If your interested in
this power supply, please e-mail me for pictures.
Thanks, Charlie Hugg, K5MBX CCA #00307

2033. FS: HAMMARLUND HQ-100A RX/SP-100 SPKR PACKAGE

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-06-22 01:09:18 UTC
From: "Robert G. Carter" <dc2light@md.metrocast.net>
Message-ID: <G7OdnVDNPryhvObbnZ2dnUVZ_gSdnZ2d@metrocastcablevision.com>

FOR SALE

HAMMARLUND HQ-100A General Coverage Receiver
w/ SP-100 Matching Speaker
SERIAL NUMBER: 24537442
FREQUENCY COVERAGE: 540 KHz - 30 MHz
MODES: AM, cw, SSB
BFO: Yes
PRODUCT DETECTOR: No
CRYSTAL CALIBRATOR: Yes, Model XC-100.
CLOCK: No
TUBES: 10 including xtal calibrator.
PHYSICAL CONDITION: 9.5 out of 10 (chassis isn't quite perfect and
s-meter plastic has a couple of very minor scuffs on far right).
The front panel, cabinet and speaker/cabinet are in unbelievably
beautiful condition. You are almost guaranteed to do a double-take
when you first see this receiver.
OPERATIONAL CONDITION: Works well. I have been using this as one
of my SWL receivers for several years now. Bandswitch is slightly
noisy on 20BS band - I ran out of contact cleaner/degreaser while
treating the bandswitch. S-meter drifts a little with time but it
has never bothered me.
OTHER THINGS INCLUDED IN THIS SALE:
Original Instruction & Service Manual, includes XC-100 Crystal
Calibrator supplement and schematic.
Repair Ticket dated OCT 9, 1970.
Owner's personal listening log from the sixties.
Original Hammarlund shipping carton for this S/N receiver.
PRICE: $265.00, Cash or US Postal Money Order.
LOGISTICS: Buyer to pick up equipment, located in St. Mary's
County, Maryland. I do not recommend shipping this equipment.
REFUND: This sale is final - no refund.

You are welcome to come by the house and test-drive this neat
little receiver. Drop me an email and we'll get you into the
restricted tech-control spaces.

Hello,

Your advertisement has come to my attention. I intended to purchase
your products for my retail store inventory located in Indonesia. I
would like to know about stock availability and the price as well. In
addition, please inform me about your conditions of delivery to
Indonesia and the payment you accept as well.

I await to hear from you and quick response would be appreciated.

Sincerely yours,

Gunawan Marianto

So did I but I noticed a distinct lack of US businesses in ham radio equipment -- notably Ten-Tec and Elecraft, both of which make state of the art equipment at prices less than their offshore counterparts. 'Tis a pity; I won't be using or recommending that web site to anyone.

All,
There was a company named ProPrints that made custom Tee-shirts with various vintage Ham manufacturers logos on the front. I have been trying to get them for a while now, to no avail. Has anyone heard of them going under? They sold under Ebay and have a website, but I am not getting anywhere in either of those directions. Any help is greatly appreciated.

rgds,
Mark S.

Moving to a retirement community so have to let some of my collection go.
This Valiant is as nice as they come. New front panel, new bezel, new heavy
duty vfo coupling, new white knob inserts, new meter shunts, all new tubes
and new power supply filters. All audio caps have been changed to .1mfd and
the clipper has been by passed. It comes with a new Dowkey change over with
muting contacts. Also comes with a pristine G-stand with a D-104 head that
has a Shure 404C element in it. Rig is plug and play 200 watts out on cw
all bands and 525 watts peak out on am. $1300 pick up only Deltona Florida
30 miles SW of Daytona Beach. Can send pictures k6xd@cfl.rr.com

Very good, now you've learned what Heising modulation is and how it's done (what components are used, etc.). Yes, Heising is inefficient, but it has two huge pluses as well: 1) it can be "added" to almost any transmitter with little modification (which can then be easily removed); and 2) it can provide excellent fidelity. So while it may be inefficient - it remains a very popular way to add AM to transmitters.

Hi,

A modulation reactor is a big, HV insulated audio choke used to feed
d.c. to the tube finals of a broadcast a.m. transmitter.
The modulation transformer itself is capacitively coupled
across the modulation reactor. This keeps
d.c. off the modulation transformer secondary windings,
to reduce risk of saturation.

Dee, W4PNT does a very credible job of painting Rangers; some say its too good. I have a Valiant I done by him and I have to say the job, itself is excellent. The "too good" comment is applicable to the new-car, clear-coat finish he uses. Its not the slightly flattened, factory Johnson finish. Were it not for that, one could not tell it from original. Regarding buying paint, my local automotive paint jobber can and will color-match (color densitometer) most any finish/color and either bulk or spray-can batch it in whatever quantity I need. What they won't do anymore is wrinkle type finishes. For that, I use Pep Boys black and gray.

Hmm... and it's got to be nice and broadband. How much DC is going
through there?

I assume the secondary winding off a microwave oven transformer isn't going
to be more than ten henries or so.

Obviously, then, you forgot how Heising Modulation worked, or you wouldn't have asked the question; and (hopeful) you've re-learned / been reminded - how Heising Modulation works, specifically the use of a modulation reactor as specified by the OP; - no sarcasm intended.

To "pick a nit" - Mr. Knobloch's description is only partially correct - in that his description is of a *modified* Heising modulator. A saturable reactor can also be used in a circuit without "capacitively coupling an output of a modulation transformer" (i.e. no modulation transformer at all) - which is a basic / original Heising modulator (as opposed to a modified Heising).

RE: early 50s: That is a long time. I've carried an FCC 1st since 66 - (when I was 16) added RADAR endorsement in 78. Still have my license hanging on one last commercial AM broadcast transmitter, though I'd like to retire from that one as well (at one time I had over a dozen AM&FM stations here under my license).

You can see the last "tantrum" that transmitter threw here:

Hey Pete!

Yes, indeed... it also allowed a "wet behind the ears" kid to hang around a radio station and meet some interesting characters. In my case - helping to move a studio from the basement of a church to more "suitable" digs... and getting to meet some of the deejays... I'll never forget sitting on the board riding the gain while Dr. Demento cut loose with a visitor: if you ever heard the Wolfman's howl live - you'd never ever forget it!!!

best regards...

This spammer, Charles M. Nudo, Jr., of Drums, PA, says rules don't apply to him and spams Usenet unrepentantly for his own eBay and Audiogon trash and for businesses he cons into paying him to spam their wares. Since having all his Google Groups sock puppet accounts shut down for spamming, he's started another one using his own "rinky-dink" Yahoo domain, 8trackaudio.com. All his spam posts originate from frontier.net (formerly epix.net,) his home ISP, and since he's dumb enough to use Google Groups, his IP is in each header.

Such eBay auction spam is a violation of both Google Groups' and Frontier.net's Terms of Service. Per his ISP's Terms of Use, it's also a violation to violate the rules of other sites, and the spammer can be assessed a minimum $200 fine for such a violation. See applicable rule statements at:

http://www.frontieronline.com/residential_aup

and...

http://groups.google.com/googlegroups/terms_of_service3.html

Fight back against Usenet spam by sending his spam message, with headers, to:

groups-abuse@google.com
abuse@frontiernet.net
abuse@audiogon.com

You can also reach Frontier's abuse desk on:

866-474-7662

Be sure to include his IP in your complaint to Frontier, which is 209.74.29.60 for this spam load.

Source record: 7585

Hi, Military Vacuumlanders,
I'm more a denizen of RAR+P and RAT but I could use some help with a BC-348-R "boatanchor". I acquired this eons ago but am only now getting around to refurbushing it. It's totally original with the dynamotor and it actually works but I'm not sure how well (I can get some stations on a short wire antenna but there's lots of harsh hum on the "long wave" band). BTW, I brewed up a 28 VDC bench supply from which to run it. A long time ago I downloaded a few manuals in a hurry but did not do a thorough check on the version - so I've got documentation for versions J, N and Q, but not R. It seems that there are several different schematics and tube line-ups for BC-348's. My schematic is for a BC-348Q and it's not at all the same as for the "R" - different tubes for a start !

By my forensics, the BC-348R has the following tube line-up:
Military tube Civilian equiv.
Function
VT-86 6K7 1st RF
VT 86 6K7 2nd RF
VT-91 6J7 Mixer
VT-65 6C5 Local Osc
VT-86 6K7 1st IF
VT-70 6F7 2nd IF & BFO osc
VT-93 6B8 3rd IF & Detector
VT-152 6K6 Audio O/P

(I hope this "table" holds together!)

Can anyone point me towards a schematic for the "R"?
All replies gratefully received
Thanks & cheers,
Roger

Try Chuck Rippel in Chesapeake, VA. I don't think he has any of the
PTOs left, but last I looked he had plenty of BFO modules.

Fair Radio also has some odd R-390A modules left over.

Many thank, K3HVG, but I have this one, viz:
"Maintenance manual for BC-348-J, N, Q. rev. 21 June 1948."
...but it is for models J, N and Q only.
The "R" has a different tube line-up (see my OP).
Cheers,
Roger

As K3HVG *correctly* noted - the BAMA site has the schematic for the R (as well as the others). For most purposes - any schematic that includes the 991 tube (which isn't in your list) will be usable for the R.

The AN which is said to include the R model, does not show a 991 tube.

Just to make doubly certain, I re-loaded the above ref manual on BAMA
and compared it with my original AN-16-40BC224-2 dated 20 JULY 1945.
The ref des for the regulator is 125. In the BAMA manual, its located
on the last schematic sheet part and in the parts list as 2V991.

Many thanks... and to other posters and emailers, too.
I have retrieved the "R" schematic! Now the harder work starts...
My plan is to keep it as original as possible but find a way to take
the dynamotor "off line" (to preserve it in the radio for "all
time"... and to cut the mechanical noise), then run the B+ from an
external regulated tube supply and the heaters from an external 4 x
6.3 = 25.2 VDC supply - I can adapt of my 28 VDC dynamotor supply,
but now only 0.7 A total. I'll go the other side of resistor "76-A"
that appears to drop 28 - 25.2 = 2.8 volts for the series/parallel
heater group (resistor "76-B" accommodating the higher (0.4 A) 6K6GT
heater current.) On second thoughts, the 25 volts could now be AC,
even easier (perhaps using a recycled s/s receiver power transformer)
- the 28 VDC supply staying untouched for "dynamotor days"!
Very best,
Cheers,
Roger

I think I have the entire "R" manual in electronic format. Send me an email and I will reply with the manual as an attachment if I have it.

Some comments on the BC-348R:

1) If yours is original, it probably still has Those Dern Black Plastic Capacitors. These are small units that look like micas but are actually paper, and they are notoriously unreliable. They fail open, shorted, and every way you can imagine. They are 0.01 uF 400 volts or so, and should all be replaced. Besides being annoying, some are in parts of the circuit where a failure takes several other parts with it. Replace them all and save yourself a lot of cussing. Yes there are over two dozen of them - I found them all.

The 348 design is such that you can have several iffy caps and the set will still work, sort of.

2) Note that the B- in the BC-348R is *NOT* grounded. It floats some volts negative of ground. This is done because the 6K6GT output stage also functions as a shunt regulator. Do NOT try to power the receiver with B- grounded, because the last stage will draw excessive current and possibly cook the audio output transformer.

The audio/regulator stage design is explained in the manual, and is quite ingenious. You can mod the set to eliminate the feature, but I always found it easier to use a power supply with ungrounded B-

3) The receiver isn't meant to drive a speaker. Not enough audio gain, and pushing the set to do so makes it sound awful IMHO.

There are three options:
A) Use only headphones, as was intended. You have a choice of 300-600 ohms or 2000-4000 ohms by changing transformer taps
B) Modify the audio chain to a more-conventional design
C) Use an external audio amp, with an appropriate resistor load to avoid frying the output transformer.

4) The dynamotor probably needs the bearings repacked. 60 year old grease isn't much of a lubricant!

5) Probably your best option is to build an external AC supply. The heaters will run on AC just fine - 24 volts at 0.7 amps (Note that the 6K6GT draws 0.4 amps for the heater, while all the rest of the tubes draw 0.3 amps). The B+ should not exceed 220 volts, and the set will work fine at 190-200 volts. With a little care, you may be able to avoid wiring changes in the rx itself by making up a dummy chassis to replace the dynamotor, and powering the rx through the rear plug, with the AC mains switch on the power supply.

6) If the receiver design seems a bit odd, remember that it was meant to be used in unpressurized planes like the B-24, under extremes of heat, cold, shock and vibration.

If you need any tubes for it, let me know. I had three BC-348Rs at one time, but sold them all more than a decade ago in a moment of extreme weakness. (sniffs, looks away, rubs speck of nonexistent dust from eye, sighs.....)

> it. Replace them all and save yourself a lot of cussing. Yes there are
> over two dozen of them - I found them all.

********** I did not know that, I thought they were micas! Will
take a look and decide what to do.

> The 348 design is such that you can have several iffy caps and the set
> will still work, sort of.

********** Ah, ha. Well, mine is working but I don't yet know how
well.

> 2) Note that the B- in the BC-348R is *NOT* grounded. It floats some
> volts negative of ground. This is done because the 6K6GT output stage
> also functions as a shunt regulator. Do NOT try to power the receiver
> with B- grounded, because the last stage will draw excessive current
> and possibly cook the audio output transformer.

********** Yes, I found this out early on when I saw that the
6K6 cathode went to ground. Smelled a rat and checked it out! The
6K6 stays properly biased with my ext. P/S.

> The audio/regulator stage design is explained in the manual, and is
> quite ingenious. You can mod the set to eliminate the feature, but I
> always found it easier to use a power supply with ungrounded B-

********** Me too, P/S is isolated. I have it running with external P/S B- going to the wire that came off the dynamotor negative and the B+ going to the wire that came off the dynamotor B+, and DC to the heater with "76-A"still in. 6K6 bias about 14 VDC.

> 3) The receiver isn't meant to drive a speaker. Not enough audio gain,
> and pushing the set to do so makes it sound awful IMHO.

********** I'm using a matching transformer from 300 ohms (LO) to 8 ohm speaker. I plan to install a proper OPT to match the 6K6 to 8 ohms but leaving the original there for posterity.

> There are three options:
> A) Use only headphones, as was intended. You have a choice of 300-600
> ohms or 2000-4000 ohms by changing transformer taps
> B) Modify the audio chain to a more-conventional design

********** See above.

> C) Use an external audio amp, with an appropriate resistor load to
> avoid frying the output transformer.

********** Not a bad idea... but needs etra bits!

> 4) The dynamotor probably needs the bearings repacked. 60 year old
> grease isn't much of a lubricant!

********** Not used now but I may repack bearings to be sure

> 5) Probably your best option is to build an external AC supply. The
> heaters will run on AC just fine - 24 volts at 0.7 amps (Note that the
> 6K6GT draws 0.4 amps for the heater, while all the rest of the tubes
> draw 0.3 amps). The B+ should not exceed 220 volts, and the set will
> work fine at 190-200 volts.

********** That's the next step. My B+ is 220 VDC.

With a little care, you may be able to
> avoid wiring changes in the rx itself by making up a dummy chassis to
> replace the dynamotor, and powering the rx through the rear plug, with
> the AC mains switch on the power supply.

********** I want to leave the dynamotor in the chassis "as is" and have an external AC heater supply.

> 6) If the receiver design seems a bit odd, remember that it was meant
> to be used in unpressurized planes like the B-24, under extremes of

I don't have one, but the following info may be of some help in finding one of the right style:

The mechanism used in the HRO receivers (removable coils, tuning capacitor shaft Parallel to front panel) was known to National as the PW dial.

The mechanism used in the NC-101 type receivers (sliding catacomb coil assembly, tuning capacitor shaft Not Parallel to front panel) was known to National as the NPW dial.

Thanks Jim,
Thanks for the info. I have a HRO 7R I'm trying to restore. I have yet to find a good photo of the HRO 7R, there are plenty of photos of the HRO 7. I don't know if the panel color is silver gray or wrinkle finish black. I wonder if certain coil sets from different HROs are comparable?

==========

The older HRO coils will work in your HRO-7. The HRO-50 coils will work too as will the low-frequency HRO-60 coils. It's the A and B coils for the HRO-60 that are different. The HRO-60 is double conversion on those bands. As far as I can tell, all the single-conversion coils are interchangeable. I have used several different low-frequency coil sets in my HRO-60 and they work fine. --Ed

Note to all:

The complete manual for the BC-348R can be downloaded from the BAMA mirror site:

http://bama.edebris.com/manuals/military-kg7bz/bc348/

Scroll down and click on:

TO 12R2-3BC-112.pdf

(Maintenance manual for BC-224-F, K, BC-348-H, K, L, R. rev. 11 February 1955)

This is a 10 MB PDF, so it will take a little time. Lots of other manuals there, too.

Me too. They are reliably unreliable. That doesn't mean the ones in yours will fail, it just means they have a bad reputation.

> ********** Yes, I found this out early on when I saw that the

The trick is that the 6K6GT isn't biased the way it would be to deliver a couple of watts as a speaker driver. Sure it will work, but it will be running flat out.

> > There are three options:

Put them in the PS unit and put the whole thing in a speaker cabinet.

> > With a little care, you may be able to

> and have an external AC heater supply.

The problem with that is the dynamotor, if not running, will present a
near-short circuit to the power supply. And the 24 volt heater line is
connected to the dynamotor input, so it will be shorted too.

By simply removing the dynamotor assembly and putting in a dummy
chassis so the loose wires don't short, you can retain the rx wiring
and run from an external supply. Then if you ever want to drop in the
dynamotor and run from 24 volts, you can do that too.
>
> ********** Thanks but, amazingly, all tubes test "good" to "good
> plus"

Not amazing, really, If the set wasn't used much, the tubes could be
almost new.
>
> ********** PS: I'll email you for the manual.

I can send as an email attachment but it's 10 MB. You can also
download it from the above site.

Big Radio/audio Auction July 21st- Northern California

The California Historical Radio Society Is holding our biggest event of the year at the historic KRE Radio Station Building, Transmitting from the same site for 70 years in Berkeley.

Giant auction of vintage electronics, including radios & phonographs, vintage broadcast gear, test equipment, communication gear and more. To support CHRS there is a $5 bidders fee.

Here is you chance to acquire a Hallicrafters SX28-A, PM-23 speaker, Globe Chief, HP's first oscillator, tube testers, dynaco preamp, etc, etc.

Master of Ceremonies: Carter B. Smith. Live performances by: Frankye Kelly & Friends & The Broadcast Legends

Tours of KRE
Discover Ham Radio with W6CF
Vintage electronic Flea Market
Food & Beverages
CHRS HOTLINE - (415) 821-9800

See photos of the auction items at:

http://www.californiahistoricalradio.com/photos72.html

Come enjoy the day!

Which HF radio xcvr was used in the SBD ca. 1940-42? My feeling is
that it would have been the ARB, but need to have this confirmed. This
is for a scene in a movie set in Guadalcanal in 1942, where a link to
home is maintained by (quote) 'a radio scavenged from a wrecked SBD'.
A serious authenticity effort is being made.

Thanks,

John Mackesy VK3XAO

Have to get rid of the 32S-1 and get a S-3 (I work all CW and the S-1 isn't
a
great CW rig). This one is serial number 7. Looks great and works great.
Full power out on 80 and 40 but drops off some on the higher bands. All
original, no mods that I can detect, no extra holes. Pictures on request.
see it in the picture of my shack at: http://webpages.charter.net/wb8cac .
Asking $400 plus shipping.

I had a reference* that (at least) early SBD aircraft had RU/GF
equipment installed. Recall that early SBD (et al) were 12 volt
systems. The ART-13, ARC-5, and most other WW2 equipment was designed
for 24 volts, of course, so could not have been used in early variants.
The ARB receiver is strictly 24 volts, I think..?

* RU-16/GF-11 manual included installation location diagrams for the SNJ
(and another fixed gear trainer?)and the SBD. I no longer have a
complete manual as I traded away my system several years ago. I will
see which pages I copied, though.

Source record: 7472

I recently picked up a Henry 2002A 2-meter amp at a swap. After a good leaning it went from scruffy to looking almost like new. The amp has had the Henry 3002 filter added and there is no information on tuning it in the manual. Sooo...after many searches on Google and finding nothing useful I'm looking fro a data sheet with instructions, or just instructions on how to properly set it up.

PS
Heaters now powered by a 24 volt HVAC control transformer - connected between chassis and pin 2 of the 1st IF tube, VT-86/ 6K7 (bypasses resistor "76-A".) BTW, these 24 volt HVAC control transformers are easy to find as scrap units (look in old house demolition bins.) I had two in my junk box - one 12 VA (not enough) and one 40 VA (too big but OK, so I used it.) You need 17 VA minimum.
B+ remains from a separate vintage Heathkit regulated tube supply - one of 3 such items here, so I can dedicate one to the BC348. My big 28 VDC supply is now surplus!
Next things to do:
1. Install a terminal block and a 4 conductor power cord to the external P/S's (DC and AC)
2. Check all those old paper caps I was warned about...
3. Check the alignment, tweak as needed (the manuals have full instructions for all those 1940's radio techs - RIP, most of them!)
Support the military! (Who is watching "Dogfight" on Discovery channel?)
Cheers,
Roger

I am interested in opinions as to the best tube-type transceiver ever produced and why?

I know there will be lots of different opinions but I am interested in the reasons behind these opinions.

Thanks!

It'd probably be nice if you'd define "transceiver"... otherwise there
is no contest... The AN/FRR-60 / AN/FRT-39/40 "set" wins hands down.
But then at a couple tons (literally)... and requiring over 60KW
primary power... not exactly your typical "base unit"...

Oh, why? let's see... 2 - 32Mc continuous tuning...
SSB (suppressed carrier)
SSB (with carrier)
DSB (suppressed carrier)
DSB (with carrier)
FSK
FAX
CW
MCW
Pulse modulation
Phase modulation

Receiver "stuff"...
Diversity: frequency or space. (this is the "super" FRR-60 - with two
full receivers paired and interconnected for active diversity).
Can handle 70db signal variation without AGC - 100 db with AGC
usable signal recovery to 150db range
AFC can track signal "drift" at least to 1KC at a slew rate of 10cps/sec.
Active noise limiting
Tunable notch filter +/- 8khz (works at IF frequency rather than audio).

Transmitter "stuff"...

10KW PEP (FRT-39) or 40KW PEP (FRT-40)
Same operating modes as receiver, including independant DSB (ISB) with
or without carrier.
Frequency accuracy to one part in 10 to the 8th. per day. (what drift?).

I'd hate to pay the power bill on the beast - but what a rig!!!!

Lamont,

Thanks for that really interesting and informative response - much appreciated. A 12V SBD! The idea of trying to start an R1820 on 12V doesn't really appeal, esp. on a frosty morning.

The choice has been narrowed down to ARB or GU, both of which are available. My feeling is that the aircraft used in combat would be the later models, which could well have used the ARB.

Thanks againm

Gee, I was thinking something like a Gonset Communicator.

Not really, but yes "transceiver" is a very wide open term. It can
go from those transmitter and receivers in one box with very little
in common, to an actual SSB transceiver that the poster likely is
asking about.

But I was going to point out that in retrospect (and if we limit
the discussion to amateur radio SSB transceivers), the time span
is about fifteen years or so. It was the late fifties when such
a thing arrived on the market, and it was over by the early seventies,
with solid state taking over. Given it's at least thirty years since
then, it is a finite selection to start with.

Yes, an incredible radio. When I was in the Air National Guard
at the Charlotte airport we had 2 complete KWM-2/A stations.
One with a 30-L1 amp on a full size 80 meter rombic and the
other with a 30-S1 on a tri-band on about 30 ft of tower.
They wouldn't let us have much tower since we were located
right next to the main runway.
The big rombic worked great during the week , but on Guard
drill weekends the field that it was over became a parking lot,
when it was full of cars it got real hard to get the antenna to tune.

I hope to have a KWM-2/A in my shack some day.

If anyone in the group is active on AM maybe we can meet on
the air soon. I bought a Johnson Viking 2 at the Salisbury hamfest
just a few hours ago.
This was about the best Salisbury fest they've had for several years.
There's was a good bit of BA gear there, and got to see a bunch
of old friends.
Besides the Viking I also bought a Diawa CN-800H cross needle
SWR/Watt meter and a couple of Waters coax switches.
I looked all over the fest for a Dow-Key relay so I can hook up
the Viking and my NC-183D for the Am station.

Certainly, and - one could go to the other extreme- handy-talkies, which are as "absurd" as my first example (which was intended toungue-in-cheek). As the OP noted - there are bound to be favorites, and keeping within the likely "bounds" he intended- one of the most world-worthy was the KWM-2/A.

There have been many tube transceivers over the years with good reputations for performance, etc. - but only the KWM-2 stood head-and-shoulders above the others in "field" reputation due to it's service with the military over the Viet Nam years. First introduced in the late 1950s, the KWM-2/A was fully mature by the time the military started looking for a "solution" for it's MARS activities starting in early 1960s. Collins had the perfect answer: A complete HAM (MARS) station in a pair of Samsonite Suitcases. One holding the KWM-2/A and the other the power supply, antenna and other accessories - the Marines first started shipping these to the troops in January, 1963.

Not only very portable, but tough. Operating in a war, in a climate that would destroy lesser equipment in weeks, the KWM-2/A earned it's reputation as a reliable, effective workhorse over the next decade years. I don't have sales figures on the KWM-2/A - but likely when combined with it's predecessor the KWM-1 - they likely are the top selling transceiver of all time.

as always - just my .02

Major brain fade! The 12V R1820 would have used an *inertia* starter,
not a direct-cranking starter.

SX receivers incorporated a simple 455kHz crystal filter (like the Lamb
circuit) with the phasing, etc. controls for setting the bandwidth.

Like your idea of leaving it 'as original as possible'. While having
it work for today using mains electric power. Good for you.
Just a thought the original system worked off 28 volt aircraft
batteries. And of course the aircraft 28 v engine generators.
Batteries have a low impedance and might have done much to 'shunt'
brush noise of the various dynamotors? Could you try adding more shunt
filter to your 28 volt supply just to see if it could reduce the hash;
presumably coming back from the input brushes of the dynamotor? Or if
from brushes on the output side check hash filter caps there?
Finally could you unplug the dynamotor and have a cable from external
PS plug into that socket? No other changes whatsoever! Retain
dynamotor (perhaps attached to PS?) for future re-installation.
Good luck with your project.

> Finally could you unplug the dynamotor and have a cable from external
> PS plug into that socket? No other changes whatsoever! Retain
> dynamotor (perhaps attached to PS?) for future re-installation.

********** No, I can't risk the physical separation - the executors
of my estate won't go looking for the dynamotor! Neither do I want to
rewire the rear P/S socket - keep it original. My solution was to
installed a new 4 screw terminal plate (2 new small chassis holes...
sorry, can't help that!) with a captive power cord to the external
supplies. The dynamotor wires were just lifted carefully from the
original 5 terminal block to the new 4 terminal one (two are shorted
together in the original - see schematic. As we all now know for the
BC348, the external B- is NOT to chassis due to the odd biasing of the
6K6 o/p stage (it's about 14 VDC negative to chassis), so keep
external B- isolated!

> Good luck with your project.

I'd agree that the Collins KWM2 transceiver is about the best for SSB service but it came at a high price. However, it was mediocre at best for CW service.

A transceiver that I believe actually sold in greater numbers than the KWM2 series was the lowly Heathkit HW101. I know that they sold over 20,000 of them.

For it's price, if you can get one that was well assembled, you can do no better. The HW101 was almost as stable as the KWM2, was FAR better on CW with true carrier insertion, sidetone, vox that worked well and an optional CW filter.

It's more expensive big brother was the Heathkit SB101 or SB102, the poor mans copy of the Collins KWM2.

Another favorite of mine was the National NCX-5. The first mass produced ham rig with a digital readout, albeit a mechanical one, that was actually accurate. It had good audio, good filtering and was reliable (with the exception of the weird T/R relay that was always energized in receive mode). It also had a decent sense of style and used sweep tubes but ran them at a realistic limit. With its companion NCL2000 2KW linear, it's a real rock cruncher of a station.

What a thing to consider! The KWM-2/2A cost between five and ten
times what the HW-101 and SB-100,101,102. did. The prices of all
three lines varied over the years but at the end, the Collins was over
$3,000 and I don't think the SB's ever went over $400. $299 sticks
in my mind for the HW-101.

Don't forget the Drake TR3's & TR4's & the later Swans (500CX).
Excellent radios. I've had several of each & they perform well. You
can pick up a TR4 with PS for $250.

The Heath stuff will have variable build quality.

The KWM2's are overpriced (I have the KWM2-A).

Arguably, a late production Kenwood TS-830S might be considered, albeit
its a hybrid type radio. It has all the features that one might really
need and they still hold a reasonable value. With the '230 digital VFO
and some after market filters, the radio will provide excellent service.
The radio also can be serviced in the field, like their all-tube brethren.

Well, as far as "normal" rigs....those you can set on a tabletop and use
very well today....
The KWM2 is useless on CW, and the band segments are broken up in the middle
of the band.
The HW101/SB102 series are great rigs, but age and the home-made aspect
means many of them have problems.
A TS-520,820,830, does not fall in to this category (tube rig)
My vote would be a TR4CW/rit. It has everything, and is solid and reliable.
Runner up would be a Kenwood TS511S
Problem is, that model Drake has had the price ebayed through the roof, and
the Kenwood is hard to find. But....waddya gonna do. They are old, and work
well...so the demand is up!.

What do you mean by "What a thing to consider"???

My point was exactly that for their prices, a well built
HW101/SB101/SB102 performs almost as well as a Collins KWM2 on SSB
and far better than the Collins on CW.
Thus in terms of their value based on cost versus performance, one can
easily argue they outperform the Collins.

As for the Drake radios, I don't like tube radios that really need
matched pairs or trios of sweep tubes to maintain performance,
especially when the supply of such tubes is rapidly vanishing.
My National NCX3/5's seem to be relatively unfussy about whether the
6GJ5 or other sweep tube used are matched.

Another great thing about Heathkits was that they used 6146 tubes in
their finals, just like the Collins.

As for Heathkit build quality, like most things, you have to try
before you buy. One that is working well on a bench today has
certainly gotten all of its bugs worked out it by this time, with only
normal age related failures to be expected.

I agree with another that the Kenwood TS820/830 series is far more a
solid state than a tube rig. I had a TS-820S - thought it was a rather

poor performer. Its CW semi-breakin operation was miserable. A transister went bad in one of the mixer oscillators. It's layered, non-plug-in circuit board construction made service access difficult.

I've been doing some remotes for a small college radio station here in Virginia, and at this point it seems to me that what they need is an old Marti link. Somebody out there has to have some of those old 26 MHz FM boxes sitting around in their transmitter room gathering dust, and we'd like to put some use to it if you've got one. The higher band VHF and the lighthouse tube UHF ones would be okay too although those bands are more often used around here and so a little harder to coordinate. Anybody have some junk they'd like to get rid of?

For unexplained reasons, I've accumulated a couple of 2m CD Gonset III's. I restored one to operation and matched the yellow paint. The second one, also a III, does not match any of several Comm III schematics I have. Specifically, it is the second unit's power supply. It does not have the -25v bias supply components installed or wired. Also, in one book, these components are clearly NOT there, either. Problem is, all the pull-out schematics I have do not include this variant. Anyone out there have a Gonset power supply chassis schematic where the bias supply is not wired up? Thanks much.

This is true. But there's a big difference between a real tube amp with
decent output transformers and this Pioneer junk.

Look again. The transformer is placarded for 119V input, and the zip
cord that doesn't appear to have a plug on it is labeled "relay" -- it's
probably there for just what it says, not to plug into the wall.

The Quim 2 was in a class by itself as a single unit (plus power supply) box in terms of overall usability but...it's a SSB only, ham band only rig practically speaking.

Drake and Collins separates that intertransceive are fine, but not really a "transceiver".

Heathkits worked well when properly assembled. Few were. Some can be straightened out with patience. The use of soldering flux and good technique can rescue some.

I started a new yahoo group. The purpose of the group is to facilitate the exchange of information. This includes informant ion on the restoration, modification, operation and the building replicas of the radios used by all countries involved in WWII. Items for sale or auction will be limited to military radios and parts.

You can join by going to this link

>
> What do you mean by "What a thing to consider"???

I mean, "BEST Tube-Type Transceiver" is a strange and difficult consideration. It's the topic of this thread.

The problem with Heathkit's SB transceivers isn't the soldering. That's an old-ham's saw. It's not quite up there with the "Acid Core" urban legend, but it's close.

While I have encountered poor solder jobs, I have only seen one problem that was clearly solder based and that was in a factory, machine-made part.

The problem with Heath are the mechanicals. The design is clever; the parts are mediocre; the mechanical build quality is generally horrible.

A case in point is the LMO pinch drive and the tension on the rings. I've spent hours cleaning and adjusting the drive and when it's right, it's terrific. It's light, smooth, precise, no backlash. I have a Heath SB tuning knob with lead weights in it. It's a perfect match for the LMO drive.

Even when you have the pinch drive adjusted right, the 100 kHz indicator is off. That's a 30 minute trial and error adjustment where 1/64 inch position shift of a piece of metal under a machine screw is amplified by an articulated arm. After the fine tuning, you're fighting the play in stamped parts.

Then there's the fiduciary on the LMO. What's with that?

Every fiduciary knob is corroded. I polished one until it shines. It's still a knob on a 1/8 inch shaft in a hole drilled in plastic, no fore-aft stop, driving a piece of wobbly plastic with friction.

Another problem with Heath are the thin skirts on the knobs. The skirts could be thicker and more precise. When I put the knobs back on a Heath, I use a feeler gauge to space the skirt from the front panel. That's after I find the low spot on the skirt.

The bezel on the SB's should be more like Collins. That was a bad place for Heath to cut corners. A thick solid bezel would give the fiduciary's drive shaft more bearing surface.

How did they get the bezels on the DX-60 and the HW-16 so right and the SB so wrong?

The phenolic circuit boards are mediocre. The design is fine. Thick FR4 glass epoxy would have made the Heath's much better.

On sheer performance, the Heath's are up there. Hot receivers, 6 pole crystal filters, stable, 1 kHz readout, etc. Drake and Halli didn't do that until they went digital.

Years ago there was a guy that was making a "solid state tube". for sweep tube replacement. It consisted of two or three transistors an a potted cast assembly on an octal base, very much like solid state rectifier tube replacements. A customer claimed he'd busted one apart and it looked like a horizontal output transistor on a plate, some small transistors, a resistor and was put in black hard potting compound with some smppth small rocks for packing. He was not sufficiently on the ball to have made a schematic.

Failing that, converting the beasts to a transmitting tube of some sort seems the only way to go,as sweep tubes are a thing of the past. Apparently they take a lot of different internals from audio types, which are the market today.

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday July 15th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and

Yes. Good point.

I don't own Drake except for a 2B/2BQ that's been in storage for 35 years. Don't know a lot about them, never operated a TR.

Overall though, the SB-102 package, as part of the Heath SB system which includes several amps, scopes, etc., was the premier 1960s/1970s set up. The weakness of the SB's was the mechanical build quality and the mechanical alignment.

Drake PTO vs. Heath LMO is an interesting comparison. My SB-102 is not seen bench time yet but I've had an SB-303 (same solid state LMO albeit without the tubes nearby) on a frequency counter for a week. The drift measured in the few tens of Hz! This was in an un-airconditioned room.

I converted my old Hallicrafters SR150 from sweep tubes (6DQ6's if I recall) to 6146s. It is still around the local ham community and running fine. The nice things about the 6146's was that they are small enough to fit in almost any PA subchassis, and all I had to do was rewire the sockets.

Sure wish I still had it. I let it go about 25 years ago!

That's very true, as regards ham gear. However later Cubic commercial
gear, from the company Swan evolved into, can be quite good.

Hi Fred,
I have a nice 220VAC @ 10A that I no longer need. It was originally used
for my 1296 EME amp, but I have now built a hi power solid state amp. This
is
a Warner Electric 236B. Although currently wired for 110VAC, it is a 220VAC
unit. I can supply connection drawings with the variac. Very nice condition.
Make an offer if interested.

TV sweep tubes don't like to be run linear. I recall seeing a 16 x 6LQ6 amplifier in the Handbook (or was it QST?) eons ago. I shudder at the thought of the IMD3 response! 6146s are a bit better than sweep tubes. My favorite tube in terms of linearity would be the 807/1625, albeit a bit taller than the others.

I still have my first SSB xcvr, a new-to-me SB102. I would concur with most of what others have said about the cheesy mechanicals. Even with fresh tubes in the frontend & IF and aligned, the receiver seemed to fall off in sensitivity above 20m. 3 elements on 15m at 38' made up for it. I added a Fox-Tango Club 500Hz CW filter before retiring it.

Does anyone have the depot repair manual for the AN/PRT-4 with the schematic? The TM that Fair Radio sales does not have it. The manual for the PRR-9 with full service documentation seems to be available on the LOGSA website, but the PRT-4 manual is not there.

These things are plentiful, a glut on the market, and might be fun on 6M if I knew what was inside them.

On the basis that a transformer, In this case a variable tap auto-
transformer, is an electromagnetic device:
Question: Could one not input the variac with say 230 volts instead of
115 volts.
Then at, say, 20% dial setting the output would be 46 volts and at
100% it would be 230 volts. Etc.
As long as the current and total power transformed are within the
ratings of the variac, would it matter?
After all transformers, either those with separate input and output
windings, tapped or untapped, or auto-transformers can be used to step
voltage up/down and so forth.

One could if the 120V variac was seriously over built. The problem is
if the variac was built using normal engineering practices, the turns
ratio would drive the core partially, or fully into saturation at 240V,
and it would at the minimum get very hot, and at the worse case, blow
the breakers.

The basic transformer design equation is:

E = 1.4*f*N*B*A,

E = primary voltage
f = frequency
B = Flux Density [typically 80% of Bmax]
A = Cross sectional area of core.

B is a non linear response of the magnetic material. It become 'flat' as the
core saturates and the current increases DRAMATICALLY.

Since f, Bmax and A are fixed for a 120 VAC design, applying 240 VAC to the
primary will 'fry' the variac and your hand, and pop the circuit breakers for sure.

Now, a 240 VAC design can be run at 120 Vac, but not vice-versa.

Hello Simon,

I presume you are talking about the DC plug. The AC (through which the batteries ostensibly receive charging current while the radio is plugged in is just a standard AC cheater cord type jack. The goofy polarized bladed plug and jack were "J502" and "P502" generics. You might be able to find a Cinch plug..from Surplus Sales of Nebraska or Fair Radio or somewhere; .not sure of the number but it will have "502" somewhere in its nomenclature. . Years ago I replaced the jack with a more standard jack to allow me to get the power to the NiCd charging circuit and I no longer worry about losing the DC cord with the oddball plug since the jack is now easily mated with a much more standard plug. You can use anything, even an SO-239 coax jack if you aren't concerned about convention or appearance :). Also I found that the NiCds Heath supplied were notoriously weak and would only survive, maybe, a hundred charges. Once I seem to remember I was able to break the internal short by supplying high current to it and "revitalize" the NiCd for another 20 or 30 charges but that was it. I built my GR-78 in 1975 and by the time Heath folded I had probably replaced that darned battery 3 or 4 times and it was fairly expensive as I recall. With the battery, too, I replaced it with, I think, two 6-volt batteries in place of the internal battery and it has worked since Heath closed its doors.

Good luck.

> I am interested in opinions as to the best tube-type transceiver ever
> produced and why?

I presume you mean "amateur HF band transceiver", and whether you allow matched-pair receiver/transmitter setups that allow transceiving on one or both of the VFOs.

I think it all depends on how you define "best", and whether you allow mostly-SS hybrids like the TS-520S to be considered "tube".

For example, if the definition is best-performing-on-SSB one-box transceiver, the KWM-2A is at the top. Yes it's mediocre on CW, has no RIT and cost the earth in its time, but for performance on SSB it was tops in its era.

If you want RIT and good CW performance in one box, the Drake TR-4cw (the latest version) is the one to have.

OTOH, if the definition is most-performance-for-your-money, it's a close tie between the Heath SB-101 and HW-101. I do agree about the mechanicals but consider what they cost in their time, compared to other rigs.

If you allow matched-pair tx/rx, the Collins S-line (meatball 75S-3C/ 32S-3) are at the top, followed closely by the Drake 4C twins.

Although I haven't tried it, there is allegedly a cure for the cheap Heath mechanicals in the HW-100/101 and SB series.

What you do is to look around for a junker Tempo One, which is actually a Yaesu FT-200. All you need from it is the VFO assembly, which covers the same range as the Heath LMO - 5 to 5.5 MHz.

Then you remove the Heath LMO/VFO and replace it with the Tempo unit. Some mods will be needed to get supply voltages and make up for the loss of the tube in the Heath LMO/VFO, but those aren't hard to do. The mechanical mods are left as an exercise for the reader - if it were me, I'd make a new front panel while I was at it. As a bonus, the Tempo VFO unit has RIT.

The Tempo VFO is solid-state, but more important, has a sweet all-antibacklash-gear drive and 1 kHz readout. (It's arguably the best part of the rig).

--

Although it's not really a transceiver, but rather a receiver and transmitter in one box with a common power supply, the Heath HW-16 has to win the award for best-HF-amateur-tube-rig-designed-for-a-specific-purpose. It was meant as a Novice rig for the privileges of its time, and except for being anemic on 15 did that job very well and at a low low price.

All IMHO

If you're going to start doing that, then any external VFO that covers
5 to 5.5MHz is a potential candidate. Even up to something like the
external digital VFO that went with the TS-830, though at the moment
I can't remember if it's a 5MHz VFO.

Or build an external vfo with that variable capacitor from the BC-221
that's been lying around for decades, and put a frequency counter
in the box. That's not even a new idea, there were things like that
over thirty years ago when digital ICs became cheap enough to easily
make frequency counters.

This thing will then work with any rig that needs a 5MHz VFO, and has
the advantage of not requiring dramatic changes to the rig. Many
will even have things in place for an external VFO.

There was a whole article in the September 1972 issue of CQ about
this sort of thing for the SB/HW transceivers, though I don't think
he used a frequency counter.

I married a Drake RV4 to my SB102 for split operation (using the SB102's
xtal oscillator as a buffer).

Agreed, but the idea (which I didn't state very clearly) is that you
put the Tempo One VFO *inside* the Heath rig, so it's still one-box.

If you're willing to do the external-VFO thing, just mount the LMO in
an external box and make a nice dial drive for it, plus the digital
readout.

> Or build an external vfo with that variable capacitor from the BC-221
> that's been lying around for decades, and put a frequency counter
> in the box.

Or a mechanical dial. I've done that for homebrew rigs.

> That's not even a new idea, there were things like that
> over thirty years ago when digital ICs became cheap enough to easily
> make frequency counters.

I made one in 1975. But it's a lot more than just a counter.

For one thing, the VFO frequency isn't the signal frequency. But the
big deal is that, in the Heathkits, the VFO tunes the wrong way (5 is
the high end of the band and 5.5 is the low end). Both are solved by
use of a presettable down-counter.
>
> This thing will then work with any rig that needs a 5MHz VFO, and has
> the advantage of not requiring dramatic changes to the rig. Many
> will even have things in place for an external VFO.

Agreed. But if you want a one-box tube transceiver, and you happen
across a junker Tempo One with a good VFO, the result could be pretty
sweet without all the work of building a stable VFO.

>
Back in the 70s I had a KWM-2 and a 2A as well as the separate 32S3
and 75S3 and other incarnations. Although the Collins had the looks
and feel, I think my TR4C was the best of the lot as an all around
transceiver. It lacked looks and feel but it worked well.
I also had the Drake B and C line twins, but was not really fond of
them.

My favorite tube rig was the KWS1 with a 75A4 which worked well and
sounded good. You could also heat the ham shack with it in the winter.

http://www.rogerhalstead.com/ham_files/boat1.htm
http://www.rogerhalstead.com/ham_files/boat2.htm
http://www.rogerhalstead.com/ham_files/boat3.htm

I also liked the old Hallicrafters seperates SX101A although the 115
was a better receiver, HT32B transmitter, and HT33B amp. I'm
currently restoring two complete sets (A and B series) although the
photo only shows one set...

>
>If you allow matched-pair tx/rx, the Collins S-line (meatball 75S-3C/
>32S-3) are at the top, followed closely by the Drake 4C twins.

Again I'd place the Drake transceiver ahead of the Collins seperates
having had both. I really didn't care for the Drake twins in the B and
C line. I will admit that was a longgg time ago and time does dim
my memory from that far back.

Roger (K8RI).

If you have some spare Millen B, C,D and E GDO coils this might be what you are looking for!

It is a Millen Type number 90651 Grip Dipper with only the A Coil (1.7-4.5 MHz) and the F Coil (60-150 MHz). I do not have the B, C, D and E coils. The unit is in average cosmetic condition.

I am asking $50.00 plus shipping for it. If interested please reply by e-mail.

Thanks,

73,

Michael

The HW-16 is a really really sweet CW transceiver. With a couple mods the break in completely seamless - it honestly feels like I can even hear the band with the key down!

> The phenolic circuit boards are mediocre. The design is fine. Thick
> FR4 glass epoxy would have made the Heath's much better.

I had many, many problems with intermittent cracked traces in HW-100's and HW-101's. They'd be fine when cold, but when the set began to warm up the opens could happen just about anywhere. Usual situation was that receive signal goes away, or transmit power does, and it's remedied by a couple sharp knocks on the chassis.

Tim.

Thanks, Vern and Scott for your replies. As a collector of old sets, I prefer to keep them original where possible. I had to replace the Ni-cads with set of AAs soldered in the same format as the old Heath one which was dead. I don't think we have cheater plugs here, but maybe under another name. Unfortunately Cinch-Jones plugs are not available in Australia and getting one from US suppliers is almost impossible these days due to either anti-terrorist legislation (export permits now needed for retail electronics) or credit card use (sorry, you have no confirmed US address). Fortunately buying from private individual is technically easier using Paypal but the new postage rates with no more seamail makes boatanchor purchases uneconomic. Simon

I rebuilt an RCA TTU-25B 25 KW UHF TV transmitter about 18 years
ago. It had 17 6146 tubes in the video modulator. What a pain in the
ass to match 16 6146 tubes for the output stage. :(

Actually, $80 is about fair for a Fisher 400 in decent shape. The nice thing about the 400 is that it uses readily-available 7868 output tubes rather than the 7591s that some of the other Fisher receivers use. (There is a Russian 7591 equivalent which sounds good, but it's taller than the real thing, and too tall to close the case on a Fisher 500).

The 7868 isn't the most linear thing around, but it's not half bad and those Fishers had surprisingly good output transformers.

I am looking for an SG-2000 ADSP1 or ADSP2. IT DOES NOT HAVE TO BE
WORKING.

If you have one, please contact me at iamw7gsa@gmail.com (iamw7gsa at
gmail dot com) or call me at 904-821-5055.

Thanks,

Bill

Are any of the BC-221 Frequency Meters of any interest to collectors? I have a BC-221-O which I no longer use and I'm trying to determine if I should just put it in the trash. Thanks!

John

I've seen this link and several variations come up frequently in Google searches for used gear, but the email addresses listed for the list admin all bounced, and I can't figure out how to subscribe either. It does look potentially useful.

It's a feed John and I know how those work but this seems to just be an
archive of some feed and where the original ad feed is? Well I'm stumped.
Maybe its a secret list??? :)

They are not worth much in terms of dollars - but collectors like them. If I see them at a swap meet for under $10 and they are in good shape, I often buy them - simply to keep them from being trashed.

I have converted one into a solid state heterodyne vfo for a Central Electronics 10B and converted one into a very nice regenerative receiver. It has a good range of parts for the regen, including a very high impedance audio choke and a wonderful tuning assembly.

They are still light enough to ship at a reasonable price. Do not be too greedy on price and you should fine a happy home for it.

Spam Trap - You are right this Item should have been posted to
"Rec.Radio.Swap" with a "FA" {For Auction} at the start of the
Subject Line so that readers will know that this was in-fact an
Item For Sale {For Auction}.

FA - R-390A Receiver (1984 - Serial #2)
eBay: http://easyurl.net/R390A

Actually to be honest and correct the eBay Seller should
have Posted eBay Auction Listing for this Item reads:
FOWLER INDUSTRIES, R-390A,
SERIAL#2, RAREST EVER MADE
eBay Item Number: 220132158407
http://cgi.ebay.com/_W0QQitemZ220132158407

But then, since this is a 'Rare' Fowler Industries R-390A
with a very low Serial Number "#2" : The eBay Seller
did feel that other "Rec.Radio" NewsGroup may have been
interested in this R-390A. Such as :
Rec.Radio.Shortwave,
Rec.Radio.Amateur.Equipment,
Rec.Radio.Amateur.Boatanchors

Why I myself did not know that some R-390As were build
by Fowler Industries. Plus the eBay Auction "Description"
itself is a very interesting and informative read about this
"Rare' R-390A Receiver. I would even say to others that
-if- you were unaware of the Fowler Industries R-390A
Receivers and you have an interest in old R-390A Receivers;
you should take the time to read this eBay Auction
'Description' for the information that it presents.

Grundig Yacht Boy 400 (or 400PE). Nice little radio to carry in your purse or luggage, but doesn't begin to touch an R-390 for performance (but then, an R-390 doesn't run on 4 AA batteries).

Interesting! I attended the Navy's answer to R-390A school more years
ago than I would like to admit and I never heard of "Fowler Industries".
Nice piece of history but agree that it should not have been posted in
several of these groups for sale. As they say, there is a proper place
for all the stuff for sale let alone ebay's rules and policies.

On a side note, I did notice a few posts stating these receivers in
general were "junk". It all depends on your perspective. The
sensitivity, when properly aligned, is still competitive with more
modern equipment. If one were to set their new ((rig) (insert your
favorite brand named, DSP, Solid state, processed, ET. here))next to a

R-390 and exposed both to one hell of a EMP, which one do you think has a chance to still work?

Not that this was in the original design specifications but the R-390 has also stopped many a bullet or shrapnel for ripping an op in two.

To reiterate, it is all a matter of perspective kind of like relativity.

Regards,
Paul WD8OSU

ISTR reading one of the R390A sites that said the Fowler unit
was built from refurbished surplus R390A parts (EAC).

As I recall, the Navy burped up a need for a couple of more R390A units
for some reason or another, and put out a RFQ. Fowler won the bid.

Or maybe I am fantasizing?

Actually, the 390A is a pretty good performer. Sensitivity isn't a whole lot better than the Yacht Boy cheapies, but the front end noise floor is better, and the selectivity is amazingly better. The selectivity for SSB and CW on the R-390A is really something you have to try to believe. Oh yes, and the front end of the R-390A won't overload. Not even with a local transmitter on the same channel. The Yacht Boy overloads if you look at it too hard.

The bad news is that the audio quality stinks, in part due to the really sharp skirt of the filters that make it so selective and in part due to power amp design. So you might prefer the Yacht Boy if audio quality is more important than DX ability.

A couple years ago I did an A/B test between the R-390A and the current generation DSP-based Watkins-Johnson military surveillance receivers. The weak signal performance was about the same for CW, although the fancy detector on the W-J was a little bit better at dealing with weak SSB signals. The digital panadaptor with the automatic signal ID on the W-J was really slick, though.... I think the W-J was a winner for ergonomics.

I wouldn't want to try and repair that R-390A, though. It's a mechanical nightmare. On the other hand, I don't think I'd want to repair that W-J either.

Which brings up the question:

You see 390As made by various manufacturers - Motorola, EAC, of course Collins themselves, and now this Fowler. Any opinions on who made them the best? Any real differences between them?

Yacht Boy can get into the sub .1 microvolt sensitivity level (10db
S+N/N)? That's pretty impressive for a solid-state receiver... usually
noise floor is a problem down below .1uv... Chuck Rippel has some that
can get into the .07 - .08uv 10db s+n/n I'm not patient enough to groom
mine that well.

> The bad news is that the audio quality stinks, in part due to the really

True, but...

So you might prefer the Yacht Boy if audio quality is
> more important than DX ability.

There's precious little (IMHO) worth listening to on SW(AM) DX these
days - and audio quality isn't too important when digging an RTTY signal
out of the chaos that is propaganda and religious broadcasters these
days...

To get peak performance with a 390/1/A - consider using a Sherwood synchronous detector, or similar...

For a "head to head" run of a Drake R8 and R8A; a pair of Watkins-Johnson HF-1000's, an R388, R390A and a JRC NRD-535 against an R390A with a Sherwood - see this:

<http://r390a.com/html/history.htm>

> I wouldn't want to try and repair that R-390A, though. It's a mechanical
> nightmare.

Once you get used to them - they're VERY easy to work on - admittedly - the geartrains can be a bit intimidating at first - but after a while - you get to don't even think about them... Of course with the 390/391 - you do learn to NEVER forget the green gear - it only takes once - and you remember from then on.

Sherry's 391 with it's power autotune - yeah - those tuning heads still give me pause - but Sherry just shrugs and jumps right into them - since she likes to keep them very clean and well lubed. (replacement parts are getting harder and harder to find - so it pays to prevent damage).

> On the other hand, I don't think I'd want to repair that W-J
> either.

This old dog is getting too old to learn new tricks... besides most of these new-fangled radios are more like sitting at this computer... no warm glow, no power geartrains slewing at break-neck speeds going from one preset to another... and certainly not the smell and sound of a 28 in the room... naw - give me my boatanchors (and it's probably appropriate to apologize to those in r.r.s and r.a.a.e groups - I didn't notice this was cross posted --- but since we're all on the subject - I'll leave it cross posted for now)...

My 390A is pretty stock - and as noted - just an average performer. Sherry cheats - she "usually" runs an R390A IF in her 391 for DXing, etc. -- though she can drop the stock 391 IF back in - in about a minute - when she wants to show off broadcast stuff (i.e. the 390A IF she uses is the only thing modified - it'd have to be "returned to stock" to go back in an "A")...

best regards...

> best? Any real differences between them?

You left out Helena-Rubenstien (yes the makeup people) --- though it's usually suggested that though they "took that specific contract (believed to be 80 radios) - they subcontracted one of the regulars to build the radios. Stewart Warner is suspected - since they had the contracts on "both sides" of the H-R contract... are were obviously in a position to build them much less expensively than most anyone else at the time.

back to your question - I'm sure there are those who nit-pick this detail or that detail - but in working with these radios over the past 35 years (and probably 100+ different radios both aboard ship and otherwise) - much of the time I have to look at the tag to see who built it - and even then - after being in the fleet for any length of time - there'll be a "mix" of modules in the radio from any number of sources. Many I worked on were Stewart Warners - which as often as not had several Capehart modules in it -- as does my current 390A - though I suspect from a couple of things the frame itself started out as a Capehart and had it's tag "swapped". That's not as uncommon as you'd think - sometimes it'd be easier to fix a radio by sliding another one in it's place - changing the tag so the "boss" didn't notice. I've been told this was rather common at some shore stations where people were more interested in "hitting the beach" than "hitting that dog"...

One of the great strengths of the Collins design - is that it is truly modular - the modules aren't dependent on a neighbor to work to it's best (i.e. there is almost no interaction of alignment / adjustment between modules. A module that works in one radio - will work just as well (in it's own right) in another radio. Obviously - an improperly working module will effect the radio's overall performance - but properly working modules can be shuffled like a deck of cards - and still work just fine - regardless of the "new neighbor".

like all things subjective - just my .02

The way the contracts worked in my experience was they would all had to
meet the original design specs/requirements.

I noticed a reference to sensitivity being .1 uV and I can tell you that
if I worked on one that was in that range I started looking about to see
what was wrong with it! While working on several banks of the silly
things, .0 something uV was the norm. I'm not saying that was the
minimum specs that were required as I can't remember just that they very
often exceeded them.

They were a mechanical nightmare and a bad thing if you were waring a
tie while aligning them. During an inspection, by an admiral no less,
one of my techs was aligning one and got his dress tie caught in the
gears. When the admiral walked in an "attention on deck" was yelled out
and this poor kid had a receiver hanging off his neck! It don't take
long for 60 or so pounds to suck you to the floor in that type
situation. The admiral was very understanding and although he didn't
offer to help the kid we all ended up going out on a relatively large
drunk.

But, still a nice, heavy, old, receiver.

I threw that number out as a point of comparison... as any 390/1/A
should perform that well as a minimum.

> While working on several banks of the silly
> things,

After working on "several banks" -- the one has to wonder - if it wasn't
the tech that was getting "silly" (if not punch-drunk!)... ;-)

> .0 something uV was the norm. I'm not saying that was the
> minimum specs that were required as I can't remember just that they very
> often exceeded them.

The specs - and the way the specs were obtained - left a lot of "wiggle
room". That's why the generally accepted measurment is made with the
radio set to some specific settings - which generally produced the most
"recoverable" signal - and that's using the 4 kc filter and standard AM
detection; signal generator at 30% modulation with 10db S+N/N recovery.
Otherwise - without knowing what the "settings" were - (and they varied
depending on what tech manual you happen to have) - everyone would be
comparing apples to oranges - rather than apples to apples.

Obviously - using a wider filter; bfo to detect carrier (or carrier
re-insertion on SSB) would allow for detection WAY down into the noise
(.06 or better). .07-.08 using the above settings (4K, AM, no BFO, 30%
modulation) is akin to pulling a 20 pound rabbit out of an egg cup -
pretty cotton-pickin' good!

> They were a mechanical nightmare and a bad thing if you were waring a

You'd be surprised how easy it is, Scott. Complete guides to tearing down and rebuilding even the most complex assemblies (the RF geartrain, the PTO) are on the web. Mine came from Fair Radio (a "used-repairable" unit) with essentially sand as the geartrain lubricant, so I went through most everything.

> On the other hand, I don't think I'd want to repair that W-J either.

My WJ is 25 years old now and holding up pretty well, too, although I'm sure it would take more than a 100W soldering iron and Bristol spline wrench to fix if it had anything go wrong in the PLL!

Tim.

The only major difference I saw between the things was in the PTO... some
manufacturers seemed to build much better PTO modules than others.

By the time the gear winds up on the ham radio side of the DRMO, though,
most of them have turned into mix and match sets. So the nameplate on the
front may not indicate accurately where all the modules from.

My experience has been to avoid the EAC PTOs. If you find yourself with
a radio with a goofy or flaky PTO, though, Fair Radio has replacements.
Don't worry so much about the rest of it.

I'd have to say that this darn thing (along with the other four) must certainly have been built out of resurrected parts. There is probably no way that a company is going to gear up, and produce five of these receivers for $38,000 each, for a total cost of $190,000. The costs just wouldn't seem to add up.

Nice receivers though, when well maintained.

The costs would likely add up rapidly for a limited run of a complex
radio like the R390a. The profits would likely not add up at all and
would likely venture into negative territory.

This is very true - get a Cosmo PTO if you can find one- they seem to be
of better than average quality - IMHO.

So it goes.

Perhaps you should read the original articles in Electric Radio
Magazine, issues 71 and 72 March and April, 1995 and get the "actual
facts." I know that would be a real stretch for anything on usenet,
but you would get an education along with the other naysayers as to
the "rest of the story."

This is a small excerpt from a list which has been discussing this
particular item.:

I've been reading the archives with interest concerning the Fowler
R-390A
s/n 2. I no longer subscribe to the list, but several friends told me
of the
activity about this particular R-390A and I wanted to clear up a few
things,
so I subscribed this morning to attempt to do that.

The story about this particular receiver was originally published in Electric Radio Magazine issue 71 in March, 1995. A close-up photo of the nomenclature tag was in issue 72 in April, 1995. That is the "Real McCoy Tag" Speculate about made up tags etc. One wasn't made for this receiver except when it was built for the U.S. Navy by Fowler Industries.

I know the owner, V ********** who was mentioned in the original article and it is indeed a "genuine" Fowler and is s/n 2. T ******** reviewed the pictures of this receiver back in 1995 and knows of the validity of this particular receiver, as do several other people.

T ********* did quite a bit of research with personnel from Fowler Industries and Avondale Shipyards regarding the five R-390A's built. That information was published in subsequent issues of Electric Radio Magazine.

I don't have the time right now to answer in detail, maybe tomorrow.

T ********* knows much more detail than I do as he spoke with the former General Manager at Fowler Industries and purchasing people at Avondale (now Northrup Grumman) Shipyards.

They built them using components, but had some difficulty obtaining certain components.Fowler: When T ********* spoke with the Plant Manager he commented that they had particular problems obtaining JAN tubes, in particular 26Z5W's and 3TF7's. Remember, that they were considered "unobtanium" in the late 80's early 90's. Then the government released surplus tubes and Fair Radio was selling them at reasonable prices (they went quickly).

They potentiometers were made in Mexico, the meters were A & M Instruments, the quality of the wafer switches were not as robust as the runs during the 50's and 60's, Dittmore-Freimuth made the mechanical filters (as they did on many later versions), as well as the ones the built themselves, which were 67 EAC receivers with Dittmore's filters.

I can't say if what they obtained, but can assure you they didn't purchase
any in the crate R-390A's. Even though they were available at various locations throughout the country. When you bid on a contract the Government
lets, you fill the requirements, and they inadvertently left the R-390A spec
in the bid offering.

Avondale Shipyards probably didn't think to do a search for "in the crate"
R-390A's and put out a request for bids to build five R-390A's. Fowler
Industries was Clavier and prior to that Capehart, so they had experience
building R-390A's and suppling R-390A spare modules (Clavier).

T ********* can pick it up from here, as that is about I can remember or
verify from back when we did the ER articles.

Signed

L ********

I'm sure you can do additional research, and find someone who has these articles. I do, but don't care to scan and post them without the authors permission as they are copyrighted articles.

Nice. However all I can do is stick with my original assumption. It would be very difficult to build 5 'totally new' R390A's for a measly $190,000. Even 1984 dollars.

Nobody said they built totally new R-390A's. They sold them to the
government for $38,500. They (Fowler Industries) were formerly
Capehart who built R-490A's, and Clavier, who manufactured R-390A
modules for a government spare parts contract. They used "bits and
pieces" to paraphrase, and assembled the R-390A's for that 1984
contract. There is much more to it and I'm not going to waste anymore
time detailing nuances to this group. I just wanted to clear the air
so to speak and inform the uninformed. Usenet has always been a place
to walk the walk, but never talk the talk. I know who you are and you

are a very experienced dx'er. The gentleman who wrote the articles is a well know archivist/historian.

Different strokes for different folks.

Harold

I hate to be overly 'picky', but read what the seller says in his description:

He refers to 'new' in several places.

Jumping Jesus Christ, you are thick aren't you?

The excerpts from the articles said many of the parts were "new,"
mechanical filters, potentiometers, meters, tubes, etc., etc. They
(Fowler) did manufacture the rear panels and other items. The rear
panels had a "certain" identifying mark on them. Fowler was a defense
contractor that manufactured many other items for the government and
had the capabilities to do so.

Get over it and listen to nibi nibi again, or that heterodyne from
Pitcairn Island.

Harold

You probably get that annoyance on an R-390A.

I prefer to use quality equipment made by R. L. Drake.

I tend to agree with you Steve. Tooling up to build five completely new R-390s for $190K would be hard to do. Fowler most certainly had access to the needed equipment and parts to do the job and that's probably a big part of why they got the job.

Looking to buy a power transformer capable of delivering approximately 1,000 VCT, 6.3 VAC and 5 VAC from the secondary with 115 VAC applied to the primary. 1000 volt winding should be capable of around 150 ma and the 6 and 5 volt windings around 2 to 3 amps. Thanks.

Brian,

Fix all the spelling errors and you might get someone to take your
website seriously.

Just passing along a little constructive advice. It's yours to take or
leave. Whatever you decide to do, don't let your wife read your
website. You will never be able to shut her up.

Tracy

Well you'd be surprised who I've done audio and amp work for over the last 20 years and not one ever mentioned a thing about my spelling. My reputation gets me work, not my spelling. But thanks for caring.

Geez a month? It ought to be perfect in a month! Anyway, goodluck with
learning how to use spellcheck. I know it's tough but I think you can
get the hang of it with practice.

Tracy

It's "good luck", not "goodluck". You're not perfect either. Now
shut up and change your tampon.

Your too stupid to even see how stupid your rally are. Ironically, people
like you always think their brilliant. Good day idiot. LOL!

Your right though, my wife is a hottie.

Yes it went over my head. I'm not used to dealing with rocket
scientists who have nothing better to do than pick on some guy who is
trying to run a business and maintain a web site. Go stuff your pie
hole with some doughnuts, Officer Net Cop.

That precision tuning capacitor was highly esteemed. Some years ago, a
small company was buying old LM and BC-221 sets just to salvage them for
a product they were manufacturing. Of course, the technology has
changed since them, and PLL frequency control reigns.

2322. Looking for TS-520 Part

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-07-24 05:37:43 UTC
From: "H. P. Friedrichs" <nospam@please.com>
Message-ID: <xumdnRQVSYCGDTjbnZ2dnUVZ_jSdnZ2d@velocitywest.net>
Source record: 7268

Hello--

I've got a TS-520S whose LSB function keeps quitting. Long story short---I've traced the trouble to the carrier board, and have determined that the problem is a 3393.5 kHz crystal that's gotten lazy. Sometimes it will oscillate, other times it won't. There are no other problems with the circuit that I can find, and other crystals installed in its place oscillate just fine.

I'm wondering if someone has got a junked TS-520 who'd be interested in selling either the crystal, or the whole carrier board ("Carrier Unit" X50-0009-01)

I realize that I can arrange to have a crystal made, and I may yet go that route, but I figured I'd see what someone might have in a coffee can on a shelf someplace.

I can be reached at hpf (atsign) gainbroadband (dot) com

Thanks in advance, and 73.

Pete

Incidentally, I have an R-390A here that is almost deaf on the lowest band (.5 -1 MC). All the other bands seem to be just fine. Any suggestion what the issue might be?

The other interesting thing about this set is that the balanced input seems to be a problem even with the correct antenna source, but the unbalanced C-connector input is okay.

Chuck Rippel worked on it and couldn't find a problem, and if HE can't find a problem...

From: Lou D <oldradios.com>
Message-ID: <46a6a726$0$12162$4c368faf@roadrunner.com>
Source record: 7271

What is the input impedance for this unit. I had thought these were used with a 500 -600 ohm output. I was informed it was 6000 ohms but that sounds high to me.

What's the DC resistance? It should be around a tenth of the impedance
at 1KC.

Lou,
I was one of those who mentioned the higher impedance. In looking at the BC-342 book, it appears that the xformer in the book dated 1942 shows a single output Z of only 2000 ohms. In later TM-11-850, dated 1946 (as amended), the output Z of the BC-312 and 342 are said to be either 250 or 4000 ohms. The TM was the one actually in the field. I've never seen a single Z BC-312 or 342? The BC-348, on the other hand, is tapped at either 300 or 5000 ohms. I've got 10-12 LS-11's and will look at one or two and see if they're marked 2000, 4000, or 6000 ohms.

2328. For IMMEDIATE Sale: (2) BC-610 (Albany NY)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-07-25 14:58:40 UTC
From: bear <bearlabs@netzero.net>
Message-ID: <13aeolm39gc583@corp.supernews.com>
Source record: 7274

Hi folks,

I have two (2) BC-610s for immediate sale!
One BC-610C and one BC-610E.
Both will require a complete strip down and repaint in all probability.

Will see one or both.

For complete details:
http://amfone.net/Amforum/index.php?topic=11608.0
and pix.

Email me with any questions, be patient, I may not be back online
until the weekend(s)... This is PICK UP ONLY. I can consider delivery
within about ~150mi for a real but reasonable fee.

Serious inquiries preferred, WILL CONSIDER TRADES (working, non
working, but some stuff I'm just not interested in, ok?)

Source record: 7279

Mind Control and Directed Energy Weapons

Do you know Mind Control Weapons and Brain Washing (such as CIA Mind Control Project : MKULTRA) ? Do you know voice can be transmitted to human's head from long distance(V2K)? (In 2002, the Air Force Research Laboratory patented precisely such a technology: using microwaves to send words into someone's head.)Do you know Directed Energy Weapons(such as: Electromagnetic weapons) and Non-lethal Weapons? Do you know that people's thoughts can be read now? Do you know Nano technology weapons (such as British MI5 Nano technology spy weapons which can control little spy mice from long distance)?

Such kinds of weapons have already been used covertly to torture and harass innocent, legal, unarmed and defenseless civilians for many years all over the world.

There are more than 1500 people who are suffering terribly from mind control and electromagnetic weapons torturing and harassment. Some victims were only 21-22 years old when the first time they were seriously tortured and harassed.

Have you ever imagined that there even was not one happy and peace day in the life, but only suffering for 5,10 or 20 years? Yes! Some victims died, but at the last minutes in their lives, the only thing belongs to them was still suffering.

Please come to help us by signing your support to stop these kinds of weapons torturing and harassing lawful citizens. Our goals:

(1) We wish a resolution from United Nations to stop Mind Control and Directed Energy weapons torturing and harassing. (2) We wish all government cooperate together to sentence those torturers according to law.

Hello:

Here is a complete, excellent condition, Drake TR-7. Station includes:

TR-7 Transceiver
PS-7 Power Supple
MS-7 Speaker
RV-7 Remote VFO
7077 Microphone
FA-7 Auxiliary Fans and cover plates
Auxiliary 7 Board #2622
NB-7 Noise Blanker
500Hz filter
1800Hz filter
6000Hz filter
Extra TR-7 relay
Original phone plug (red)
MS-7 speaker feet
TR-7 Service Kit
TR-7 Manual

All from original non-smoking owner, with original shipping cartons !

$1500 OBO over $1300.

Shipping in 3 cartons, 2 will be heavy, 1 will be light. Insured shipping
estimate is $100. Any over payment of shipping will be promptly refunded.
Ship ONLY to U.S. contiguous address.

Can also deliver within 75 miles of Hartford CT.

The word "cash". I've heard directly from the seller... for some reason
ebay took exception to cash as a payment - even though it's OK according
to their own policy... (i.e. if it's an in-person deal like a local
pickup). They killed the auction without talking to the guy, and he's
having one heck of a time getting an explaination out of them. IMHO -
it sounds like some newbie at ebay jumped without knowing what they were
doing - and ebay is trying to ignore it like it never happened.

so it goes...

> What were the differences between the DX-100 and the DX-100B?
>
> Was there a DX-100A?

No, they went straight from the plain to the B model.

Differences:

100 -> 4 crystals or VFO, switched from front panel
100B -> 1 crystal with switch inside cabinet

100B -> chassis punched for connectors for the SB10 SSB adapter

100 -> course loading and fine loading control
100B -> larger gear driven loading capacitor

100-> knobs point with narrow white lines
100B -> knobs point with white triangles

100-> multi piece cabinet
100B-> one piece cabinet with hinged hatch on top
for access to the crystals

This information is paraphrased from Chuck Penson's
book, "Heathkit, A guide to the Amateur Radio Products"

-Chuck

wrote:

> Was there a DX-100A?

Not formally, but you may see informal references to "DX-100A"

What happened was this:

The original DX-100 used a relatively-small air variable loading cap
for fine adjustment, and a bunch of switched fixed caps for coarse.

In practice, this combo turned out to be unreliable in ham use, and in
the DX-100B the combo was replaced by a large air variable loading
cap.

Heath sold a retrofit kit so that DX-100 owners could replace the
small-air variable-cap-and-bunch-of-switched-fixed-caps arrangement
with the DX-100B style setup. Retrofitted DX-100s became known as
DX-100As. I don't know if that's an official Heath name or just
something hams made up. I do know that when Heath came out with the
new model, they called it DX-100B.

At least that's the history I knew.

--

btw, if your DX-100 has only one fuse in the primary side, it needs to
be modified so each power transformer has its own fuse.

I would suspect it to be higher than 600 ohms at 1 KC, then. If you want
to be absolutely sure you can make a bridge with a true RMS voltmeter
and a 200CD.

I have decided that the radios I purchased over the weekend are more deserving of someone else's time and expertise.

With all that I have going on right now, these radios will better serve anyone who has the time and desire to restore these wonderful radios.

I will entertain a reasonable offer on each radio. If do have pictures of each radio both inside and out.

I am selling an Emerson 550, it is in a condition that could lead to a nice radio. Radio is missing a knob,the veneer is intact, the box, deck and indicator look average. Easily could be a top shelf radio.
$30.00 O.B.O.

I also have a Stewart-Warner 9000B, it is a train wreck on the outside, radio is missing knobs, the indicator plate is clean and the electronic deck appears to be intact. Could be used to complete your current S/W project.
$20.00 O.B.O.

Lastly, I have an Air Castle, I have not been able to identify the model. It is an average radio, the veneer is intact, the box is average and the electronic deck also appears to be intact. The dial is good shape and functional. Also could be a top shelf radio.
$40.00 O.B.O.

Since these radios were produced between 1937-1947 I did not attempt to plug in any of the radios. I felt that it was in the best interest of the person restoring the radios to not have to clean up a mess in the deck. All equipment here is sold as-is. S&H are not included in these prices or offers.

If you are interested in any of these radios please contact me here or at n4jzh@yahoo.com

You really gotta have that center tap? No way around it? You wouldn't
be willing to go the full-wave route?

Have you considered rewinding the original one? Usually it's just the
HV winding that goes bad.

From: Bill Ogden <wogden@attglobal.net>
Message-ID: <limsi.29$5o4.0@newsfe12.lga>
Source record: 7207

Really stupid question: When checking resistors while restoring an older receiver, is it common to attempt to check the resistor while it is in the circuit? That is, make a guesstimate of the parallel resistance (working from the schematic). Or, should I disconnect one end of each resistor to check it?

(Am working on an S-85. Have replaced most capacitors. No hum and the B+ voltages are OK, so the original power supply capacitors seem OK. General sensitivity is still low, so resistor checks seem to be next on the list. IF and RF alignment are OK. The last owner had the local osc above the signal on band 4, which was the only serious problem. Tubes are OK, I think.)

Why an S-85? It was my first receiver, way back when (with a Heathkit Q multiplier).

It depends on the circuit. Often even if there is a
parallel resistance path you can tell if a resistor is very
far from its value without lifting it but an accurate
measurement usually does require lifting one end. Carbon
composistion resistors are not very stable so its common to
find very old ones which are way out of spec.

If you check it in-circuit, it will read at or lower than the resistor
value. It could be _lower_ because there is other stuff in the circuit
in parallel with the resistor. It could be _the same_ because that stuff
may not have any DC resistance when the thing isn't powered up. It will
not ever be higher unless the resistor is bad.

Since most resistors fail into a higher than normal value, or open, rather
than into a short, measuring in-circuit gives you a good quick way to find
a large proportion of bad resistors. But it won't find all of them.

Where did you check the B+ voltages? I would be apt to check plate and
cathode voltages at each tube and make sure they are roughly sane.

>Why an S-85? It was my first receiver, way back when (with a Heathkit Q

I'd be inclined to check the voltages on the tubes with the receiver
operating. Compare the readings with the ones in the manual. Be sure to
use a high resistance voltmeter so you don't load the test points and get
bad readings. No 20k Ohms per volt boatanchor meters.

Don

I agree with voltage checks at the actual tube socket with a good, very good, i.e. high impedance [FET or equiv], voltmeter. If voltages are within 5% of correct values, then the resistors should be within spec. If voltages are 15% off, then replace.

With the S-85 you can remove the tubes which opens one side of the tube bias resistors. So, with the tube removed plate decoupling resistors, screen grid resistors, cathode resistors can be checked in circuit.

Secondarily, typical A-B carbon composition resistors absorb water vapor and swell/crack with time/age. This is easily found by an eyeball exam with a little magnification for those of us over 60 years old :-).

Finally, use a good contact cleaner on the bandswitch wafers. You can use a Q-tip for those hard to reach places.

snipping here...

Check the instruction book to see if it specifies the
type of meter used to get the readings in the chart. Very
often older receiver voltages were measured with low
resistance meters, around 1000 oms per volt. If you use a
modern very high resistance meter the voltages will read
high. For example, nearly all the specified voltages for the
SP-600-JX were measured with a 1000 ohm/volt meter except a
few which specify a VTVM.

Bill:

I'd suspect screen bypasses and cathode bypasses if the receiver is very old. By all means disconnect one end of a resistor unless it connects to a tube in which case you can pull the tube while measuring. If two resistors are in parallel, the other one could be faulty , givign you a false measurment.

Thank you all for the responses. I will work with the following points:

1. Determine if the manual specifies the nature of the VOM/VTVM used to read voltages. IIRC, many manuals of that era specified 20K ohms/volt meters --- but some manuals did not specify anything at all.
2. If a resistor starts going bad, it usually increases in resistance. I did not know this, and it is a very useful bit of information. As mentioned, if an in-circuit resistor measurement is much higher than the nominal value, then there is definitely something wrong.
3. Consider pulling tubes to effectively "lift" the ends of some resistors, making measurements easy.
4. If nothing else works, lift one end of a few resistors.
5. I am over 60 also, and using a glass to inspect the resistors could be interesting.

Regards,

Bill - W2WO

You might consider a headworn magnifier. There are some very inexpensive ones sold by guys like Parts Express. I always pooh poohed them, but then I actually tried one and it makes work MUCH easier. Also, a very strong bench light helps a lot. You may not realize how much easier it is to work with a very strong light until you try it.

Source record: 7221

We all have to acknowledge the impressive and generous effort of Paolo Califano IW2DGS of Milan Italy, who has very patiently scanned the whole collection of 116 Geloso Bullettins (1932 - 1972) in pdf format. Just the issue n. 30 is missing, but I am sure it will soon be found and added.

The Geloso Bullettins were the only Geloso publication, and then contain all the characteristics, diagrams and manuals of everything the Geloso factory built across its life period (transmitters, receivers, radios, transformers, components, etc., etc.)

Although text is in Italian, in many cases an English translation is available.

A quick-search guide of all Geloso equipment is also available.

The whole Bulettins set takes about 1.9 Gbyte, and then easily fits a DVD.

Enjoy at http://www.openfreedom.org/BTG/files/BTGeloso.htm

If you wish to thank Paolo IW2DGS for this very nice example of ham spirit you may write him at his e-mail address:

his callsign at alice.it

Great observation RE; 1000 ohm per volt. As we move forward [AKA get older] we forget!

A high impedance meter must be used to measure the AVC/AGC line. This line has typically megohm range resistors and a 1000 ohm/volt or even 20Kohm/volt would give false readings.

If you use a modern voltmeter you have to correct for the current NOT being drawn by the meter [50 microamps/volt [old style] to 0.1 microamp/volt for typical modern meters] when measuring operating voltages.

Richard, you made a great observation. TNX. /s/ DD

Came across a jar of old crystals at a garage sale today. I saved them from being tossed into the garbage. The home owner says they were in the house when they moved in and were about to toss it.

I'm going to take them to a swap meet next weekend but there is one item in the bunch that looks unique. It's a hallicrafter 455Khz crystal filter in a holder. Looks like one of the crystals except the top is rounded.

http://www.vambo.org/tmp/OldXstals.jpg

I suspect whomever gets the crystals would not have a use for the filter and it would site on someones shelf. So, I would like to see if anybody here has a use for it before I take it to the ham fest.

Huh?

Up until the mid to late fifties, the only crystal filters you'd see in
equipment consisted of a single crystal. Even after mechanical filters
came along, and even after crystal lattice filters made it into ham
equipment, there were still those filters made with single crystals.

Chances are pretty good that whateve you have, it's merely a crystal.

Yep! It is a single 455 KHz crystal in a standard FT-243 [if I recall correctly] size case.

This type "filter" is very common in radios well into the 60s. It is used in it's series resonant mode in the first 455 KHz i.f. amplifier tuned circuit. The technique did a fairly good job of sharpening the selectivity of the older moderately priced AM type receivers.

Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors

Double-posted to rec.radio.amateur.homebrew and r.r.a.boatanchors

Tubes in their original boxes are easy to store; just line them up on little shelves which have enough "lip" to keep them from falling off. But what about tubes which are NOT in individual boxes? I currently have boxes and boxes (shoe-box size boxes) of loose tubes (mostly 7- and 9-pin and octal bases; plus a few bigger ones, such as 807/1625, 1619, etc.) Has anyone found a really-good way to store loose tubes?

I've considered making some flat shelves (with enough "lip" ...) and just laying the tubes down horizontally side by side. I've also drilled some tube-base-diameter holes in a piece of 2x2 (actually 1.5x1.5) so they'll stand on end; looks nice and would be easy to mount as shelves, but will probably cost a fortune in spade drill bits!

Any suggestions?

How about some 1/2 or 3/4 inch pink insulation "styrofoam" board? Cut it to fit on top of a shelf. Maybe drill a hole for the tube's plastic center indexing post (if it has one) and let the actual pins poke into the styrofoam to hold the tube to it...

Egg cartons? Cut a tube side hole in the top. In my location, they are
now using plastic ones rather than the old pressed paper ones.

Buy replacement boxes! Antique Electronics Supply stocks them, so do a
lot of hamfest tube dealers. They aren't expensive.

I have bought a few of the big flat egg-crate boxes from AES, and they work fine.

If you have small glass miniature tubes, I found a cheapo solution by accident last winter. The local hardware store sells replacement C-9 Christmas bulbs both in small 25-bulb egg-crate boxes (some of which I bought to replace the previous year's burned-out outdoor lights) and loose in bulk bins.

I found that the leftover bulb boxes were perfect for storing loose miniature tubes. The mini tubes fit right in. Metal octal tubes fit OK if you store them upside down, so the projecting base clears the divider.

I suspect that this store receives all of those bulbs in the same 25-bulb boxes and then empties some into the bins for people who only want to buy a few. Which means they probably crush a few hundred of those nifty little boxes in the months leading up to Christmas.

Costs nothing to ask. If you volunteer to stop by on the nights when they stock the bins, and carry away all that pesky cardboard, you might come home with a bunch of free storage boxes, and even save a piece of a tree!

I have what I believe to be six solid-state 872A replacements. They were made by Motorola and have the part number SDA 188 and date code of 1967. They have plate cap and 4 pins base with locator pin on side to fit Johnson socket. They are 3- 3/16 high and a diameter of 1-13/16. Aluminum can with ceramic base and epoxy filled. I am wondering if anyone has any data on these to confirm that these are 872 replacement. I have done several WEB searches but was unable to get any good hits. Thanks Tom Wb6iqd

Simpson and other VOMs do not have enough voltage to exceed the forward
breakdown voltage of a high voltage rectifier which are normally made with
a number of diodes in series. I know the correct pins. I want to comfirm
these are 872 replacement and not some other.

If these are random used/unknown tubes of no particular value, the economical solution is to toss them in shoeboxes or larger boxes and not do anything to protect them. It's questional economics to keep them lying around for another 20 or 30 or 40 or 50 more years!

If these are known good tubes with some value above zero, cardboard boxes for all the common tube sizes (in particular the sizes you mention) are available from AES, Angela, etc.

If you are a distributor with thousands and thousands of tubes coming in from the far east or Russia, eggcrate-divider packing is popular.

Tim.

If it has the same pinout as the 872, and the has the same series resistance
as the 872, and it has as high a breakdown voltage as the 872, I'd say it's
an 872 replacement. It might not say so in the catalogue but it still is.

Without knowing the device's PIV and current rating,
it would be hard to say what it replaces. The resistance
would be different from a vacuum
or mercury vapor if the replacement is solid state.

I'd try an older Motorola TwoWay shop for advice.
A lot of hams work in them, and one of them might
have first hand experience with the part. Most
Motorola part numbers are a lot longer--the one you
gave doesn't look quite right.

It has two single ended audio output transformers that are Western
Electric and a mike input transformer that is Telefunken. I don't know
if the modulation transformer is useful for audio. A pair of the output
transformers recently sold on e-bay for about $250. It would be possible
to use the unit without the transformers using an external audio amp.
The Unit is in good condition but I have never tested it. I do not have
the dynamotors.

OK... I'll pass on the unit. Perhaps parting it out would be your best
bet, financially.

Yeah.. Nice receiver, beautiful to look at, but the price is kinda of steep.
I suppose for those that have the extra $$$$ it might be okay. But, I think
the market has spoken and 8G's is the limit right now. I was surprised
at the high reserve, which hasn't been revealed!

I used to use cigar boxes. I told the guys at the local drug store to save
them for me.
I would sort the tubes and if I had enough of one kind I would dedicate a
whole box to it and sometimes I would make dividers.
I know hey have stuff down at he Walmart better than this now..

If you're referring to the two line filter chokes, they are to prevent/reduce RF leakage from the generator onto the AC line. You can wind new ones using about 18T of #16 wire on a 1/4" air core. Also, you could simply bypass the internal chokes and use one of the new, sandwich-type RFI/EMI toroid line filters, externally on the line cord. I'm curious as to how the originals went bad?

What makes you think they went bad? As I recall, they are made with huge wire, maybe 18 ga. How can that fail?

If it really DID fail, try replacing it with a Corcom EMI filter. Much more effective than the original filters, and it meets current leakage ratings (which the original bypass caps probably do not).

I must have missed something? The seller never posted this auction
on the newsgroups. It started
as a discussion about the receiver, not as an auction teaser.

2450. AN/PRT-4 manual

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-08-15 21:57:29 UTC
From: kludge@panix.com
Message-ID: <f9vss9$8ev$1@panix2.panix.com>
Source record: 7096

I have managed to find the depot repair manual for the AN/PRT-4
handheld transmitter, which I have whined about here in the past.
These transmitters easily cover the 6M band, and they are very
cheap and plentiful on the surplus market.

But now that I read the manual I realize why they are such lousy
performers. It appears one of the requirements was that the same
crystals be used on both the transmitter and receiver.

SO, the transmitter has a local oscillator, with the crystal, operating
10.7 MC away from the final frequency. Then it has a second local
oscillator operating at 10.7 MC, with crystal control AND with a varactor
diode to skew the tuning for modulation. The outputs of these two
oscillators are mixed together to form a product that is on frequency.

BUT! It doesn't stop there! The waveform that results is lousy, so
there is a PLL with a fairly narrow operating range, which locks to the
modulated signal, and the PLL shakes back and forth with modulation. The
output of THAT goes to a wideband amplifier and then to the antenna.

Needles to say the audio distortion is higher than it ought to be, and
the parts count is too.

And once again, rec.radio.amateur.equipment is not a buy and sell
newsgroup. It's for the discussion of amateur radio equipment.

Hence ebay posts don't belong there, along with all the other ads
that get posted there.

That's the problem with the previous replyer, he still doesn't use
that leverage to get rid of the ebay poster. He somehow thinks
ebay is somehow worse than buy and sell ads.

It would be nice to say that the ad doesn't belong in .boatanchors
but the people who created it circa 1995 or 96 decided that
buying and selling was too important a part of the hobby, so they
let ads in, though in the charter it's way down on the list of
things to post about. So instead, we get all kinds of ads there,
things that weren't even born when the last boatanchors were made,

and those ads for guns and those ads for computers, and so it goes.
Once you let ads in, the junk follows.

It wasn't about ebay - it was about a *VERY* rare (I don't normally use that word, but here it truly applies) radio - a boatanchor at that - that just happened to be on ebay. Fowler R390As are rare - there were only five built, and s/n 2 is in (reportedly) the best condition of the known survivors...

I didn't start this thread - as I assumed it would find it's way to r.r.a.b on it's own (it did - and no it wasn't posted by the seller, nor on his behalf).

I did start a similar thread on rec.antiques.radio+phono as a discussion about how it might compare in value to some of the *rare* sets from the 30's (Zenith Strat, Sparton Nocturne, Crosley WLW - etc.). As it turns out - not even close.

The seller didn't need to "hawk his wares" here or anywhere else for that matter - the radio's provenance yelled loud enough on it's own.

best regards...

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday August 19th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Was thinking about it, but unfortunately - the only BA I have for sale
is "tied up" until after Monday... Had hoped to see about snagging a 28
KSR or ASR at the fest - but looks like we're not going at all...

oh well...

By the way, I have several things I'd like to sell if anyone happens
to be coming to the hamfest and is interested.

R390A HF Receiver
WV-98C VTVM
ME26-D/U (Military version of the HP410B)
TEK 561A 'scope
HP201C Audio Signal Generator

Reply on or off list if interested.

Thanks,

Barry - N4BUQ

2459. Vintage AM station

Ralph W4ZO came over this afternoon with my Viking transmitter
in the trunk of his Crown Vic.
After some adjusting of the contacts on the Dow-Key relay
it's on the air.
You can see a photo of the AM station here,
http://radioheaven.homestead.com/AMstation.html

It's sitting on the right hand side of my big green chair.
The rest of the ham shack is on the left side.

If 75 meters gets a little less noisy maybe I find make some
QSOs.

3.885, really 3.88456 according to the freq counter.

Every time I see one of those I think back to the time I built one
from a kit. Was still in high school. I was so proud of that
transmitter. Used crystals initially before I modified an ARC-5
transmitter as a VFO. Of course those days are gone forever, but
there is nothing to compare them to these days.

Not really. Back in those days it was somewhat of a miracle to get
things running and operating correctly. You felt a real sense of
accomplishment to get a station running well. Now you just go to the
store, buy a radio and plug it in. I suppose in some people's views
that is better.

Considering the "caliber" of some "operators" - it not only may be
better - it may be the only way some "get on the air"...

Often then, many others wish they hadn't.

just my .02...

2464. A spotty BC348 history

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-08-17 19:01:02 UTC
From: Engineer <junk2007@rogers.com>
Message-ID: <1187377262.931007.5040@19g2000hsx.googlegroups.com>
Source record: 7110

Hi, all.
I thought I would anchor the the known (by me) history of my BC348R receiver... and share it with any interested parties in this group. Any updates and/or corrections will be gratefully received. Warning: long post...!
Cheers
Roger

A BC348R history

"We are only the temporary custodians of our collectibles..." Anon.

Early history
1943: RC348R S/N 16743 was built by Belmont Radio under a large contract with the US Army Air-force. It was delivered to the San Antonio air-force base and likely installed in a B-series bomber (B24, B25, B26... no information on this.) Subsequently, S/N 16743 may have flown thousands of hours in WW2 to who knows where... Britain, Germany, China, Pacific islands campaign? We know it was not the Doolittle raid or it would be scratched up a bit!

1945: Continued US service in peace and local wars... could have been anywhere... Europe, Asia, Korea, US home front? Whatever happened to that aircraft and her crews, S/N 16743 survived without a scratch.

1960's (speculation) Aircraft was decommissioned and S/N 16743 put in storage or sold surplus to, I suspect, someone in aviation or avionics. It was used in receive-only mode at some point since the power socket jumpered where the "mute-receive/transmit" switch is wired. Some time afterwards it was taken to the town of Shawinigan, Quebec, Canada.

My history
Early 1970's: I got his unit in the early 1970's. I lived in Montreal and had recently got my private pilots licence. My air transport pilot friend, John Ainsworth, said there was a couple of surplus "aircraft radios" in an FBO's office at the Shawinigan airport, that we could buy "as is". He closed the deal at CDN$50 for them both (almost the same as US$50 back then.) I flew John up in a Cherokee PA-28-140 to pick them up (still have the logbook entry.) They were both "R" models and were alleged to have come out of decommissioned US Army Air-force B25's or B26's, but I have forgotten the details. We put them in the back seats of the Cherokee (checked the weight and balance!) and flew back to Montreal. John took one and

I took the other, SN16743. I have no idea what happened to John's BC348 and since then we have lost touch.

Mid 1970's
For a while my unit was a static display, I was too busy to look into getting it working. A year or so later I got around to restoration - it did not seem to need much visually. Everything was there, including the dynamotor. Someone had bridged pins 2 and 6 of the power plug so it had been at least tried out on receiver-only mode, i.e. no transmitter hooked up.

Of course, I needed a 28 VDC power supply so I built one... but not very well, I'm afraid! I built a regulated P/S using a series regulator transistor (a T-03 based OC28, IIRC) and a zener diode in the classical circuit after a transformer and FW rectifier. I made two mistakes, one easy to fix the other nearly fatal. The easy one: the base current of the OC28 at full load was too high for the zener, so I added an extra transistor as a current amplifier (IIRC, as an emitter follower after the zener.) Problem solved. The second, and more serious, mistake was using a power transfomer with too high a secondary voltage. I had purchased a 250 VA Hammond transformer that had a 40 VAC secondary with the notion of having enough volts to drop across the series regulator transistor. Of course, there were too many volts and it got too hot! (it had a decent heat sink, too.) I tried various work arounds, e.g. using choke input (but I did not have the right choke, it was too small), and series resistors ahead of the regulator - but they got too hot. Finally, I put a separate wirewound resistor in the 120 VAC lead to the MT and adjusted it so that only 3 volts or so was dropped across the OC28 at about 1.5 amps... about 4.5 watts in the OC28. It worked but was a nasty kluge to my mind. I actually put the ww resistor in a separate porcelain jam jar away from the chasis, always meaning to put it on posts top-side later.... never got around to it. Anyway, we got power!

Back to the radio... I took it down to our then country place near Magog, Quebec, planning to put up a decent SW antenna... in the meantime I strung a longish wire out of the window to a nearby pine tree. Radio worked on all bands but the dynamotor was quite noisy so I did not listen much. Then I got distracted from the project and the BC348 stayed unused for over 15 years...

1999: Fast forward forward. We wanted to divest ourselves of property in a potentially "separatist Quebec" and get out (should have done this in 1976, or at least in the 1980's... never mind!) We sold the country place and stored the radio in our Montreal townhouse. In 1999 my wife and I moved to Thornhill, north of Toronto (what a relief!), since I had been offered a great job as VP Engineering with a company in North York (Toronto) just south of the 401. Radio was moved, of course, along with tons of other stuff, but that's another story. Put the BC348 in storage again.

2007: Eight years went by and I spent time on other things, including my engineering work, restoring commercial tube radios, building tube amplfiers, skeet shooting and relearning the piano. Circa 2007 the BC348 at last got onto my "do list" as "test tubes and refurbish". In the Spring of 2007 I actually did something about it! I had already searched out manuals and schematics on the 'net, so the first task was to test all the tubes. All tested "good" to "very good". Then, fix that bloody P/S! The regulator was not needed. The BC348 takes a nearly fixed current of about 1.25 amps at 28 VDC so a choke input P/S properly designed would do the job. Fortunately, I now had the right choke to hand so I simply gutted the old P/S and brewed up a simple unregulated unit. It worked fine with very minor fixed resistor voltage correction. Now to the radio...

It was, of course still working. I used a matching transformer from the 300 ohm "Low" phones output to an 8 ohm loudspeaker but the sound quality was very bad and power very low (designed for phones.) To keep the radio original, I fitted a small commercial radio OPT (6550 ohms to 4 ohms) into the chassis (not much room, you have to be very creative with space.) Using a spare 6 ohm LS this matched the 6K6GT o/p tube quite well. The old OPT was left in, of course, for future change back to original. I wired the 4 ohm secondary to the jack sockets to one of the original phone jacks so that I could plug in a 4 to 6 ohm speaker. It all worked perfectly, lots of audio power now, around 2 watts.

Now for the important part... I wanted to bypass the dynamotor so that it would not wear out - it was too noisy anyway. But I did not want to remove it from the chassis as it could get lost over the next 200 plus years... (This note will be kept with the radio, inside the chassis.)

I disconnected the 5 dynamotor leads from the dynamotor terminal strip and connected them to a new 4 terminal strip (one point is common), carefully mounted under the chassis near the dynamotor - there's not much room, I used standoffs and two new holes (allowed!) I connected this terminal strip to a 4 wire cable to the external P/S's. This cable is actually a 3 wire plus insulated shield cable (shield, red, black and white.) Red goes to what was dynamotor B+; black goes to what was dynamotor B minus (NOT chasssis, it's NOT the same - check the schematic, you "smell a rat" when you see the 6K6 cathode is connected to ground); shield goes to chassis and white goes to pin 2 of the 6K6 output tube (NOT to the old 28 VDC + as there is a resistor ("76-A") that drops the 28 volts to 25.2 VDC for the series parallel tube heaters.

For the B+ I used a Heathkit regulated power supply set to 200 VDC (up to 220 is OK.) The heaters are in series-parallel across the 28 VCD supply with resistor "76-A" to drop 2.8 volts and another one to even out the 6K6 heater's 0.4 amps and the other tubes' 0.3 amps. PIn 2 of the 6K6 is at 25.2 volts above chassis so I used a 24 VAC HVAC control transformer to run the heaters - AC is fine for this, no hum at all.

That's about it to date., No alignment done - it seems good enough for now. No paper caps replaced yet as all voltages across them are normal. It receives on all bands but I don't have an outside antenna (no space.) I plan to take it over to a ham friend's house shortly and try it on his 160 foot "long" wire to see what it will do.

So, some more history has been preserved for posterity... It's an honour to own... correction: to have temporary custody, of an original piece of equipment used by those brave men of the US Army Airforce in WW2... somewhere under the atmospherics of today's SW stations your can just hear the faint echo of those big Wright-Cyclone radial engines, the bursting of flak and the roar of twin 1/2 inch Brownings...

Great History - enjoyed the read.
I fllew radio op in Navy Super Constellations in the mid 50's -- we had a
BC348 at the Radio Op position.
On off duty hours I would listen to stations all over the Pacific on the
shop BC-348.
Thanks for the memories (as Bob Hope sed)

I cannot speak for all cases, certainly, but I understand that the aircraft factories did the original installations of radio equipment during the final phases of airframe construction, to include the cable runs and antennas. I have some drawing copies from Consolidated that show the placement of the BC-348, BC-375, direction finder (MN-26?), interphone, control boxes, etc., and to include the associated cable requirements and antennas within B-24 aircraft that they were manufacturing, at the time. Also, when the aircraft were ferried from the various factory locations to the designated military airdrome, the radio equipment was operational. That is not to say that equipment was not installed by the military.. to the contrary, especially when things were upgraded, etc. As an aside, I also have a technical tome that seems to indicate that Norden bombsights (the sight unit itself) were installed by the military under some sort of an umbrella of security.

As a collector and user of a BC-348N and an R, used with an ATC-1 and a BC-375, I appreciate the history of these receivers and would be curious about the actual lineage of my units. I know one of mine was apparently never put into service by the AAF. Rather, it was sold at surplus, NIB, by Radio Shack in 1948. I have the original receipt, found inside the cabinet, as bought from the original owner's family in 1999. My other unit was obviously "used". I really don't have a clue as to how many truly "combat-operational" sets made it to the surplus market. I suspect most were decommissioned along with the associated airframes. I think this is why there are so few rack mounts for many aircraft sets vs. the number of radios. Try and find a rack for an ART-13! It took me 15 years to find the actual aircraft rack (not to be confused with TCZ ground version mounting).

Finally, I'll add a tech suggestion. Some BC-348 versions have a gain-leveling pot, mechanically attached to one end of the tuning capacitor shaft. Its supposed to keep the receiver gain level over the tuning range of each band. You can get just a bit more gain by bypassing this pot. If the pot is going bad, it can help a lot to bypass it, of course!

2468. WTB: 11 pin "octal" m/f cable plug pair for Yaesu FTdx400 & FTV-250

Back to DEERFIELD - Again!!!!

W1RC and friends invite ALL radio enthusiasts to attend the
Fall 2007 NEAR-Fest at Deerfield on Friday October 12th and Saturday
October 13th 2007! The Deerfield (NH) Fairgrounds was the site of the
legendary "Hosstraders Tailgate Swapfest" for fifteen years until the
event was moved in 1993. "Hosstraders" is just a fond memory now but
NEAR-Fest is continuing the "Grand Tradition" and returning to the
magnificent Deerfield Fairgrounds.

Full details may be found at: www.near-fest.com

It is still possible to get 'that ole feeling' ... !!

Yep! It really is possible!

This past spring I bought a cosmetically very good set of 'nostalgia' equipment using eBay. I bought an HQ-145, DX-40, Drake LP filter, D-104 microphone, a DOW-KEY SPDT relay with auxiliary contacts, a great condition Vibroplex and a VF-1. [This stuff dates to about 10 years into ham radio [~1965] for me].

It took almost three months of electronic restoration to get everything operating to specifications. The first night I made a CW contact on 40 meters brought back memories of my share in the olden golden days. The next night I entered an AM QSO on 75 meters [a little tough with 40 watts]. Ah! the feeling!!

Now the 'bad' news ...

Due to age of switches and recurring oxidation on the contacts, the receiver needs routine attention for the switched circuits. But, it is different to turn on the station and HAVE to WAIT for a minute or so before I can hear anything.

The most difficult restoration was the threads of the DOW-KEY relay. Oxidation swelled the threaded surface and had to be removed [jeweler's rouge & tooth brush].

Yep! I also have a few store bought ICOMS for HF, three in fact. It is absolutely amazing what can be packaged in 1/2 a shoe box! The NOSTALGIA station weighs 50+ pounds and takes one full bench. My three ICOMS together don't weigh 1/2 that much, all fit on one bench with room to spare, and they operate NOW ... no waiting :-)

For those who would like to relive 'that ole feeling' I recommend reassembling a NOSTALGIA STATION.

My "nostalgia station" will be a MicaMold CW transmitter or my old Globe
Scout
40A with a VF-1 VFO. The more basic beginner ham receivers awaiting
restoration
are a Hallicrafters S-53 and a S-20R. So many projects, so little time!
But, I am looking forward to some fun CW contacts with those old rigs!

Pete

What a coincidence... my first receiver was a National NC-183 (didn't have bandspread calibration for 15m). And, in high school, the club station (WA7NUA) used a Viking II transmitter.
73,
Bryan WA7PRC

Hi,

I'm looking to buy a 30 to 50 Henry modulation reactor for a home brew transmitter near completion. It needs a current rating of 500 mA or more. Something from an old 1KW AM broadcst transmitter would be perfect. Anyone have one? Decent reward paid for the right one.

Thanks and 73,

Chuck...K1KW

: >not schizophrenic (but is 'pretending' to be so) or 'he' is
: >a product of a number of persons (?psychology students).

: Given other ways in which I have seen people exploit some of The Internet's
: capabilities to disrupt or indulge in sophistry, or to exploit a medium
: that resembles speech without the non-verbal and intonation cues, etc
: as a means of denigrating others, I question your use, albeit in quotes,
: of the word "remote". I'm not saying it isn't remote and therefore it is
: great, I'm just saying that I don't think we can easily classify it as
: remote, moderate, or great.

I think you can build up quite a good picture based on what someone says
and on their posting patterns. I don't think "The Internet" (capitals, no
less) is as opaque a medium as you make it out to be.

: It is not easy to determine the validity of all information on The
: Internet without making use of extra supplementary information.

: We do have the problem, pointed out by someone else, of the possibly
: "too perfect" textbook characteristics of what is being posted.

I explained that one, but I don't mind explaining it again (you don't
mind having it explained again to you, do you now?). The reason my
"symptoms" are such a perfect fit to the textbook is because the people
causing the campaign "fitted me up" in such a way that what they did
would resemble the symptoms of schizophrenia. Hence TV, radio, other
media, people in the streets etc. By a fortunate coincidence (for them)
these mthods of harassment are the ones which offer easiest channels of
access (for them).

It's really quite neat. All it takes is for people to start believing
that the "symptoms" aren't symptoms but reality, though, and the house of
cards collapses in a heap. And there are _lots_ of people now who knoiw
full well what has gone on.

: If harrassment by email, etc, has happened by someone out of the country,
: can a complaint be made that results in arrest or whatever upon that
: person's entry into the country? An interesting point which Mike may be
: able to inform us about, as he's said he will be in the UK in a few weeks
: time.

Picture the scene at the airport;
"I arrest you for being Mike Corley and mailbombing people"

"But my name isn't Corley. Who he? Mailbombing isn't illegal is it? You'd
have to lock up a lot of people if sending annoying email was a crime"

"Er....."

==========

: context-free parts of articles, conversations and things-on-the-TV and
: assume they are meant for you. Mike, this is called paranoia.

But that's the way real abuse works, too. People interject words and
phrases into what they say which they know will have meaning for the listener.

And sometimes, they make it obvious. The very first evening of my job in
Oxford, we went for a drink with the technical director, and a couple
of other employees. The TD said in an "as-if" aside to one of the others,
"Is this the bloke who's been on TV?" (he said it directly in front of
me, and obviously meant mke to hear him saying it). The other person
replied, "Yes, I think so".

I think the subtext of what the TD said was "Why are they bothering with
him? He's so insignificant, why would they possibly want to spend the
resources going after him and putting all that expensive technology in
his home, when there must be much better targets?". The Technical
Director was given to sometimes disrespecting people, you see, and in my
case he couldn't see the point of anyone expending money on harassing me.

: >for the harassment, which is real. It alows people who otherwise would
: >consider the harassment seriously to disregard it. It makes conversations
: >with a lawyer or police brief when otherwise it would merit discussion.

: The point is that there are two possibilities happening here-

: 1. There's a large conspiracy of people out to get you, for no
: other reason than that they have the means to do so, and that
: it involves a lot of the Media & a proportion of the public

: 2. You (who admit to having some headspace problems) are suffering
: from acute paranoid schizophrenia.

: Possibility #1 is _possible_, but would be unprecendented (OTOH,
: how would we know?), unfeasible, and many other things beginning
: with _un_ which I can't think of at the moment. Besides, if there
: was something going on, chances are some of us here would know
: about it, and I'm convinced that nobody does.

"Unprecedented" hits the nail on the head. It _is_ unprecedented, but we
have only just reached the technical stage at which it is feasible, and
we know video-spying is done to other people (NB the Diana-Hewitt
episode) and is a routine tool of security agencies.

Perhaps what is unprecedented is not the technical side, but the social
manipulation of many people by a concealed element in what other
countries would be called the secret police. The most disturbing element
is the degree to which people allow themselves to be unquestioningly
manipulated by an evil element within the state.

Peter Ceresole (peter@cara.demon.co.uk) wrote:
: In article <Ds0L1o.BMF.0.bloor@torfree.net>,
: bu765@torfree.net (Mike Corley) quoted a typical, overblown Bernard Levin
: piece, which sounds exactly like any number of other pieces by Levin over
: the past thirty years.

: He then goes on to draw an anguished parallel with a totally unrelated
: incident that had happened between him and a friend a few days earlier.

It is in the same style as his other pieces, but it's so close to what
actually happened a few days previously, that it's completely reasonable
to assume that someone told Levin about the meeting, hammed it up a
little bit and motivated him to write that article.

Look at the parallels;

1. "madman running loose about London"

2. it's about a meeting which took place recently

3. the police are called (he must be controlled, however much that
consumes in resources)

4. he might be violent, approach with caution, yes we're laughing but
really we're afraid of him, or is it perhaps our own propaganda that
we're letting manipulate us

5. he "bursts into tears, and swears it's all true - and it is" a very
exaggerated impression of the conclusion of that meeting

Don't worry if you don't believe me, neither my friend to whom I
explained this nor my GP believe me either (until the friend found out
otherwise!). If someone just presented this to you as I am presenting it
now then I wouldn't find it credible (most likely), so it's not until you
actually find out it's true that you can find it credible. And by then
it's too late, because they've got you in their trap and explained how
"funny" the abuse is.

David Stretch (dds@leicester.ac.uk) wrote:
: In article <19960418.000817.55@hotch.hotch.demon.co.uk>,
: Iain L M Hotchkies <iain@hotch.demon.co.uk> wrote:
: >The (remote) possibility remains that 'Mike Corley' is either
: >not schizophrenic (but is 'pretending' to be so) or 'he' is
: >a product of a number of persons (?psychology students).

: Given other ways in which I have seen people exploit some of The Internet's
: capabilities to disrupt or indulge in sophistry, or to exploit a medium
: that resembles speech without the non-verbal and intonation cues, etc
: as a means of denigrating others, I question your use, albeit in quotes,
: of the word "remote". I'm not saying it isn't remote and therefore it is
: great, I'm just saying that I don't think we can easily classify it as
: remote, moderate, or great.

I think you can build up quite a good picture based on what someone says
and on their posting patterns. I don't think "The Internet" (capitals, no
less) is as opaque a medium as you make it out to be.

: It is not easy to determine the validity of all information on The
: Internet without making use of extra supplementary information.

: We do have the problem, pointed out by someone else, of the possibly
: "too perfect" textbook characteristics of what is being posted.

I explained that one, but I don't mind explaining it again (you don't
mind having it explained again to you, do you now?). The reason my
"symptoms" are such a perfect fit to the textbook is because the people
causing the campaign "fitted me up" in such a way that what they did
would resemble the symptoms of schizophrenia. Hence TV, radio, other
media, people in the streets etc. By a fortunate coincidence (for them)
these mthods of harassment are the ones which offer easiest channels of
access (for them).

It's really quite neat. All it takes is for people to start believing
that the "symptoms" aren't symptoms but reality, though, and the house of
cards collapses in a heap. And there are _lots_ of people now who knoiw
full well what has gone on.

: If harrassment by email, etc, has happened by someone out of the country,
: can a complaint be made that results in arrest or whatever upon that
: person's entry into the country? An interesting point which Mike may be
: able to inform us about, as he's said he will be in the UK in a few weeks
: time.

Picture the scene at the airport;
"I arrest you for being Mike Corley and mailbombing people"

"But my name isn't Corley. Who he? Mailbombing isn't illegal is it? You'd
have to lock up a lot of people if sending annoying email was a crime"

"Er....."

==========

: context-free parts of articles, conversations and things-on-the-TV and
: assume they are meant for you. Mike, this is called paranoia.

But that's the way real abuse works, too. People interject words and
phrases into what they say which they know will have meaning for the listener.

And sometimes, they make it obvious. The very first evening of my job in
Oxford, we went for a drink with the technical director, and a couple
of other employees. The TD said in an "as-if" aside to one of the others,
"Is this the bloke who's been on TV?" (he said it directly in front of
me, and obviously meant mke to hear him saying it). The other person
replied, "Yes, I think so".

I think the subtext of what the TD said was "Why are they bothering with
him? He's so insignificant, why would they possibly want to spend the
resources going after him and putting all that expensive technology in
his home, when there must be much better targets?". The Technical
Director was given to sometimes disrespecting people, you see, and in my
case he couldn't see the point of anyone expending money on harassing me.

: The point is that there are two possibilities happening here-

: 1. There's a large conspiracy of people out to get you, for no
: other reason than that they have the means to do so, and that
: it involves a lot of the Media & a proportion of the public

: 2. You (who admit to having some headspace problems) are suffering
: from acute paranoid schizophrenia.

: Possibility #1 is _possible_, but would be unprecendented (OTOH,
: how would we know?), unfeasible, and many other things beginning
: with _un_ which I can't think of at the moment. Besides, if there
: was something going on, chances are some of us here would know
: about it, and I'm convinced that nobody does.

"Unprecedented" hits the nail on the head. It _is_ unprecedented, but we
have only just reached the technical stage at which it is feasible, and
we know video-spying is done to other people (NB the Diana-Hewitt
episode) and is a routine tool of security agencies.

Perhaps what is unprecedented is not the technical side, but the social
manipulation of many people by a concealed element in what other
countries would be called the secret police. The most disturbing element
is the degree to which people allow themselves to be unquestioningly
manipulated by an evil element within the state.

Peter Ceresole (peter@cara.demon.co.uk) wrote:
: In article <Ds0L1o.BMF.0.bloor@torfree.net>,
: bu765@torfree.net (Mike Corley) quoted a typical, overblown Bernard Levin
: piece, which sounds exactly like any number of other pieces by Levin over
: the past thirty years.

: He then goes on to draw an anguished parallel with a totally unrelated
: incident that had happened between him and a friend a few days earlier.

It is in the same style as his other pieces, but it's so close to what
actually happened a few days previously, that it's completely reasonable
to assume that someone told Levin about the meeting, hammed it up a
little bit and motivated him to write that article.

Look at the parallels;

1. "madman running loose about London"

2. it's about a meeting which took place recently

3. the police are called (he must be controlled, however much that
consumes in resources)

4. he might be violent, approach with caution, yes we're laughing but
really we're afraid of him, or is it perhaps our own propaganda that
we're letting manipulate us

5. he "bursts into tears, and swears it's all true - and it is" a very
exaggerated impression of the conclusion of that meeting

Don't worry if you don't believe me, neither my friend to whom I
explained this nor my GP believe me either (until the friend found out
otherwise!). If someone just presented this to you as I am presenting it
now then I wouldn't find it credible (most likely), so it's not until you
actually find out it's true that you can find it credible. And by then
it's too late, because they've got you in their trap and explained how
"funny" the abuse is.

Given that Mr Corley clearly holds a certain fascination for some people,
and that his website, although "informative", isn't exactly ideal for
encouraging discussion of the sort that we all enjoy so much (including
Mike himself, by the look of things), would anyone be up for a Mike
Corley newsgroup - uk.fan.mike-corley, alt.fan.mike-corley, whatever?
(Sorry, I'm not very well up on these things.)

This would be a perfect place for Mike to post his writings, and perhaps
the occasional "look at the ...mike-corley newsgroup" posting in uk.misc
and so on would be accepted in place of the current cross-posts.

Sad, confused and emotional disturbed Mike Corley wrote:

{ snip }

Because he has made himself into a martyr and now he finds it impossible to back down. Mike's big secret has now been exposed. He made everything up.

Every time Mike makes allegations against the police, MI5, Tom-Dick-and-Harry etc. those organisations have taken people off vitally important work to ascertain whether or not there was any substance in Mike's ranting allegations.

When I'm told by someone who really does know such things that there was never any plot to get Mike then I trust that person sufficiently enough to accept his word.

The problem is Mike has escalated matters to an extreme level and like many silly billys he will find it impossible to give up all his self created crap and to live a normal life. After all what can Mike do now this crap has been exposed as untrue ? What new cause can Mike dedicate himself to ? (Some might read that as: who else can Mike now start upsetting ?)

So Mike write to John Major, c/o the Private Secretary, 10 Downing Street, London SW1A 2AA and ask the Prime Minister to help you. I'd normally disclose his fax numbers but if I did that you might jam up the lines with abusive postings just like you do here on Usenet.

Is anyone interested in joining with me to do a mass e-mailing of protests to Anon Penet and to Toronto Free Net in an attempt to flood their computer systems thus forcing them to seriously consider pulling the plug on Mike ? I'm not sure but is my proposal called a "flame" ?

> for email addresses.

Perhaps we should give Mike 7 days from today (6 July 96) to come to his senses and they start a massive multiple E-mailing campaign to Toronto Free Net. If all us victims send multiple copies of E-mails to the right addresses in Toronto then perhaps the Canadians will begin to get the appropriate message.

Copy e-mailed to Mike, just so he knows what is coming if he persists.

I see. So they're not wasting six years of manpower to persecute you. They're wasting six years of manpower to prove I'm _not_ being persecuted.

I wish I was clever enough to think of something like that. I really, really do.

>When I'm told by someone who really does know such things that there was
>never any plot to get Mike then I trust that person sufficiently enough to
>accept his word.

Come on "Big Ears", why don't you admit that you made this posting? This is exactly the same line you were feeding me a few months ago. The posts are from the same news server, it's even the same newsreading software (Forte Agent .99e/16.227).

I'm afraid that if you friend "in the know" denied the existence of a plot then he was being, as they say, economical with the truth. Judging by the extreme reaction in London in May, and the panic you're showing now, as well as the replay post yesterday, I would say that things are hotting up again. But for you this time, not for me. I am out of harm's way, and there is very little you can do as long as I stay out of the UK.

Sad, confused and emotional disturbed Mike Corley wrote:

{ snip }

Because he has made himself into a martyr and now he finds it impossible to back down. Mike's big secret has now been exposed. He made everything up.

Every time Mike makes allegations against the police, MI5, Tom-Dick-and-Harry etc. those organisations have taken people off vitally important work to ascertain whether or not there was any substance in Mike's ranting allegations.

When I'm told by someone who really does know such things that there was never any plot to get Mike then I trust that person sufficiently enough to accept his word.

The problem is Mike has escalated matters to an extreme level and like many silly billys he will find it impossible to give up all his self created crap and to live a normal life. After all what can Mike do now this crap has been exposed as untrue ? What new cause can Mike dedicate himself to ? (Some might read that as: who else can Mike now start upsetting ?)

So Mike write to John Major, c/o the Private Secretary, 10 Downing Street, London SW1A 2AA and ask the Prime Minister to help you. I'd normally disclose his fax numbers but if I did that you might jam up the lines with abusive postings just like you do here on Usenet.

Is anyone interested in joining with me to do a mass e-mailing of protests to Anon Penet and to Toronto Free Net in an attempt to flood their computer systems thus forcing them to seriously consider pulling the plug on Mike ? I'm not sure but is my proposal called a "flame" ?

Perhaps we should give Mike 7 days from today (6 July 96) to come to his senses and they start a massive multiple E-mailing campaign to Toronto Free Net. If all us victims send multiple copies of E-mails to the right addresses in Toronto then perhaps the Canadians will begin to get the appropriate message.

Copy e-mailed to Mike, just so he knows what is coming if he persists.

Can't disagree with that sentiment.

Wasn't it documented that MI5 sometimes "bought" journalists and broadcasters?
I remember reading a report by some jouralist who had been offered an extra
tax-free income by MI5 to become their covert mouthpiece, and had refused.

Bet you lots of others didn't refuse. Why do you think MI5 have such easy
access to the BBC and media? Because they're directly paying them off, that's why.

It has been reported several times. The most recent was in Private Eye,
a few months back. As I recall they also wanted information from him;
journalists would be a natural choice for members of the Security Service
and the Secret Intelligence Service for information sources.

> It might be interesting to see what he had to say regarding their
> attempt to recruit him.

He was most concerned that many others would have accepted such an
offer. However, we can probably make an educated guess as to some of
those who accepted: Nigel West (Rupert Allason, MP) and Chapman Pincher
would come near to the top of the list.

This is true. I frequently employ private detectives to spy on people
(there's a good reason for this and I'll tell you if you guess
correctly) and one such detective showed me the latest technology only
last week. A small rucksack. One strap of the rucksack has a tiny hole
in it that you wouldn't notice unless someone pointed to it. That's the
camera: the wires lead into the rucksack itself where there is a video
tape recorder little bigger than a Walkman. I don't know if that's what
Roger Cook uses but it certainly explains why it is that the subject can
look straight into the lens and not realise (s)he's being filmed. Now, I
say "latest technology" and I think that's the technology that the
police use as well as the retired police who become private detectives,
but no doubt the security services have far more sophisticated
equipment.

: > In summary, for there to be a serious possibility that Mike
: >Corley's allegations are true, there needs to be evidence of two
: >things. Firstly, there must be evidence of subversive activity on
: >his part. Secondly, there needs to be evidence of MI5 taking
: >measures to counter this subversive activity, in proportion to the
: >magnitude of the threat posed. Upon reading Mike Corley's posts,

: Alan,

: What about the following scenario? MI5 conducts "experiments" including
: field trials of novel surveillance methods. Say there was a "research
: project" underway to see just how invasive a surveillance of an
: individual could be. Perhaps it wasn't research, perhaps it was for
: training of novice personnel. Either way, there is a sizeable risk of
: detection. In order to minimise the consequences of this, you choose
: someone who is out of the public eye, and if possible someone whose
: credibility is already damaged - by diagnosis of schizophrenia, for example.
: This will facilitate the "plausible denial" if something goes wrong.

: I think this would be closer to Mike's theory.

: Mike, if you are reading, please don't post the story again. Anyone can
: read it at [snip] if they are interested. Also, don't
: think that I actually *believe* the above. On cost alone, it is extremely
: unlikely to be true, and some elements of the story (people in the media
: being "in on it") are just too crazy (though I can see how the paranoia
: builds to the extent that you can see "them" everywhere).

My argument is that the fact that it's so totally crazy is what makes it so
plausible and so hard to prove.

I shall continue to try to find ways to kick down the house of cards. Because
it is a brittle structure. It only needs one person to corroborate, and then
it's all over.

: P.S. Anyone else ever thought of "what-ifs" along the same lines? I
: remember as a boy daydreaming that maybe I was the focus of national
: attention in a "let's follow the life of one person from life to
: death" study - that while I was out or in bed there were programmes on
: the television about my life so far, etc. It makes for a good fiction,

Perhaps MI5 have become victims of their own paranoia. Their agency has been thought of as acting disreputably, so when their decision arrives, they don't think twice about breaking the law. Whereas say CSIS (the Canadian equivalent) is at pains to point out how it would never ever do anything in contravention of the law, and how it is strictly controlled in what it does and how it does it.

If this matter does ever make it into the public gaze, then it won't just be a few individuals in the media or security service who'll get hit. The UK is supposed to be a civilized democratic country (East Germany called themselves a democracy and they had the Stasi, but anyway). In a civilized country these things shouldn't be happening - and it is ultimately Parliament and the government who are answerable for not imposing sufficient restraints and accountability on those who are supposed to be ensuring security for citizens, not jeopardising it.

I don't have florid symptoms. But I'm in a difficult situation, because those people who don't know, aren't going to believe, and those who do, they just go along with the crowd. It's never a good idea to go against the grain, and the grain here is defined by interests in the establishment and the media. Even people who could say out loud what was happening won't, because then there's a risk that they'll be seen as traitors and ostracised.

Usually this type of 'hidden abuse' is racial and targetted at a racial minority within a country. You keep the minorities out of the good jobs, but you don't admit discrimination exists. It happens everywhere, not just in Britain. The persecution that is going on now is in reality a refined form of racism. Instead of "nigger" it's "nutter", and abusing the mentally ill is still socially acceptable today. In 50 years it might not be, but today there isn't any social or legal sanction against it.

So really they've refined racial harassment down to a minority of one. The words may be different, but the methods are the same.

Well, the "legal option" has just foundered on the rock of lawyers refusing to deal with me on the grounds that my perception of harassment must be due to the disease.

So we're back to square one again, the same place we were two years ago.

Now perhaps one of our uk.legal participants can clarify this point. To me it seems illogical that lawyers should have the final say on whether you are allowed to proceed with a civil case or not. Is there a default mechanism or agency for cases such as mine where it is difficult to find a solicitor to represent you? What exactly is the "official Solicitor"? What is it possible to do if you can't find a lawyer to represent you?

A chance to get a useful response out of the uk newsgroups! perhaps they can be good for something else besides spamming.
.....

Represent yourself....like the defendants in the McLibel trial.
you will need to read some law..but you CAN legally represent yourself I believe.
Mike W.
.....
From: burridge@osiris.win-uk.net (Paul Burridge)

Yes, a lot of people do this nowadays. Saves on legal fees too. Lots of reading up required first, though.

What can I do to get competent legal help though? If the case is on the face of it so bizarre that no solicitor would represent me or talk to me, then surely there must be a default mechanism? What is the "official Solicitor" that's been mentioned?
.....

All you need do is go to a good library & read up about it - that's what the McLibel 2 did.

Subject: "Absolute Obscene" David Hepworth (GLR)
Newsgroups: uk.misc,uk.legal,alt.radio.uk,uk.media,uk.media.radio.misc
Organization: Toronto Free-Net
Summary:
Keywords:

Last night (21/Feb/97), I was listening to BBC GLR. You have to understand that I was listening by stealth. Back in 1990 I used to have Capital blaring out of the speakers all over the garden ("if he listens to Capital then he can't be all bad", thanks ever so much). But now I listen on my walkman on headphones with the volume turned right down. It could not possibly be overheard by any listening device, no matter how sensitive, because sound does not carry from the headphones.

Yet somehow they are still able to tell which station I am listening to on the walkman. And last night, I bravely tuned to GLR 94.9FM at around 8.45pm. Everything went well for the first half hour or so. The DJ (today GLR told me it was David Hepworth) had a "rock star spelling competition" (how do you spell Shakespear's Sister?), no trouble there. I was recording the show onto tape just in case anything unpleasant happened, as I had reason to think it might.

Around 9.10pm, it did. Here, precisely, is what Hepworth said after the song "Come Around" by the Muttonbirds (I have this on tape, and at some point will be posting the audio on my website);

"New album's called 'Envy of Angels', that comes out soon, that's the single that's already out, I would imagine, that's 'Come Around', the Muttonbirds, er, coming up after this, we got the rock-and-roll A-level, we have, I assume, Brian do we have an embarrassment of prizes in there, we do, don't we, (EMPHASIS) absolute obscene (END-EMPHASIS) amounts of prizes, there will no doubt be a riot at the back door", and that's, er, A-level coming up after this"

The key phrases in what he said are, "EMBARRASSMENT of prizes", and what he himself emphasized verbally, "ABSOLUTE OBSCENE amount of prizes". It is my belief (based on content and tone of voice) that when he spoke these phrases he knew I was listening, and that the phrases refer directly to my situation. The "EMBARRASSMENT" is the embarrassment he and other media people would feel at having their wrongdoing exposed; the "ABSOLUTE OBSCENE" (which he verbally emphasized) described the disgusting sexual abuse which the harassers have been throwing at me.

Needless to say, I can't prove this is what he meant, although this has happened enough times that it's hard not to recognise it when you see it. But I shall be sending him a copy of this explanation. We'll see what he has to say

for himself.

I will try to explain with greater clarity.

I am prone to have ideas of "interactive watching" by people on TV, and
"interactive listening" by people on the radio; which means as I listen to
their programme, they are aware that I am listening (because my home is spied
on, and those doing the spying phone up the radio station and tell them that I
am listening to them), and they then interject nasty remarks in what they say.
This is what I believe may have happened on Friday night with GLR, and what I
was trying to explain in my article.

It's happened before with other radio stations, most worryingly when I am
listening quietly on my walkman as happened on Friday. This time, the
interjected words were "embarrassment" and "absolute obscene". The "absolute
obscene" referred to the abuse which is currently being directed at me.

I hope that's a little clearer.

Subject: "Scandalous, Frivolous or Vexatious"
Newsgroups: uk.misc,uk.legal
Organization: Toronto Free-Net
Summary:
Keywords:

A couple of weeks ago I issued a summons against the BBC in my local county court, for the tort of private nuisance caused by the spying by their newsreaders on my home. My argument was that their spying had prevented me watching the news at home, and therefore interfered with my normal use of my home.

The BBC's Litigation Dept at White City have replied not with a defence, but with an application for my claim to be struck out because;

(a) it discloses no reasonable cause of action; and/or
(b) it is scandalous, frivolous or vexatious.

Their application will be heard next week. They have not made any affidavit in support of their application, nor have they given particulars as to why they consider my summons to be unarguable in law, which would be a necessary condition for there to be no reasonable cause of action.

I am more worried about point (b). Allegations are scandalous (says Stuart Sime's book) if they impute dishonesty against another party; which my allegations do, against the BBC's newsreaders. As for frivolous or vexatious, I think that will be up to me to make a good argument for the effect the BBC's spying has had on my life, and up to the district judge's opinion of my case.

Apparently seeking to have a claim struck out in this way is common practice when the plaintiff is a litigant-in-person. Even if it is struck out, there is always the opportunity to appeal. I think we could be in for a fight next week.

Yep. Just not, the, I think 180 posts, one week, when his illness
got really bad. Oh yeah, and there was only three real posts,
just repeated 60 times.

>Mike does a first class job of drawing out the real personality
>of the person hiding behind a node name. The way people react
>to Mike gives it all away.

Erm, explain this rather dubious statement.

>As for you. Don't you think it's a trifle condescending to refer
>to people as mad. I know they are homeless and without internet
>access, but maybe they are just eccentric.

Congratulations. This is my first real flame for about a year.

I try to control my anger when I come across another uninformed
naive idiot on usenet, but sometimes it goes free. We've had Corley
for well over three years now, and his constant spams of various degrees
have killed a couple of usenet groups I really rather lied. uk.media,
to name but one. I gets my goat to read another useless fucker
thinking he is a harmless eccentric.

Mike is mentally ill. He is unwilling to deal with it. He seems to
think that uk.misc is some sort of forum that MI5 reads. And it
should be avenged. He's mailbombed a large quantity of people,
because they opposed his spamming.

1. He thinks MI5 watches him through his television
2. He thinks all references to mad people, refer to him
3. He thinks all people shouting, are shouting at him.
4. He's been diagnosed as mentally ill, just not a paranoid
schizophrenic.
5. He gives not a shit about any newsgroups he abuses.
6. He goes through quiet periods, then _very_ nasty periods.
7. All evidence of this great conspiracy is laughable, to say the
least.
8. He gives internet/usenet a bad name to the media. Including
mailbombing Chris Tarrant and faxing various celebrities.

I do not condescend to him. I actually know what he does, and has done
in the past, and am frankly not too respectful of him. He can be openly
referred to as "mad" because he is. Let's check my mailbox saves:

>MC had seen the light and stopped spamming.

He hadn't seen the light at all. His level of spamming had got to
such outrageous proportions that we had to mount a concerted
attempt to get his account(s) closed. The reason for the lack of
spam lately is that Mike has been furiously swotting up on Law so
he can bring an action as a LIP against the BBC (all solicitors
having quite rightly and honourably declined to act for him). When
this course of action is exhausted without result, I confidently
predict that we will once again be the innocent victims of his ire
and the spamming will commence again.

Subject: I am being ignored
Newsgroups: uk.misc,uk.legal
Organization: Toronto Free-Net
Summary:
Keywords:

Something mildly unusual is happening. Nobody has been getting at me for the last couple of weeks. Best of all, about three weeks ago I bought a video recorder to try to get some evidence from the News etc, and despite having watched Martyn Lewis, Michael Buerk and the whole lot of them, not one of them has said anything to me in the last three weeks. And I have been listening to and recording Capital, with no ill effect. All in all, I am being comprehensively ignored.

Of course, I should have video-taped the news programmes back in 1990/91/92 (and even 93) when it was still all going on. Anthony Johnsson (casually name-drop to stick the knife in) will tell you how intelligent a person I am, yet I didn't have the good sense to record the programmes at the time, and it's a bit late now.

Today another avenue of exploration closed when my second summons against the BBC was struck out (basically through lack of evidence), and an order was made by the district judge saying that I could not sue John Birt again without the express permission of the court. She explained that this was for my own good, to save me the summons fees. Costs were not awarded though (the BBC didn't even really seek costs), and I am free to sue anyone else I take a shine to.
.....
It is not that you are being ignored.... it is just that as your mental health improves, so your paranoia eases.

OR...

The dark forces are gathering strength for the final battle with you...

Seriously though, it's nice to see you back - cos as long as they are persecuting you, I can relax knowing they haven't got time to bother me!

Mike Corley (bu765@torfree.net) wrote:

[unreasonable optimism snipped]

Well, that didn't last very long, did it?

Capital Radio this evening approx 8.35pm, Neil Long's programme a few moments after I switched to it (I am listening to it as I type this). The following spouted from his mouth;

"want to see Jacko in town? what a gig it's going to be, that guy is amazing, and PSYCHOTIC, but amazing on stage, 0171-4200958, on stage he's a MADMAN but he's wonderful"

God, I am so tired of this. It's been going on for seven years. When's it going to stop?

I have the above extract on tape. When I get around to it I will post it, and the Hepworth snippet, as audio files on the website. Of course, all the doubting Thomases and Smids can carry on doubting, because the mere fact that moments after switching on the DJ starts talking about "psychotic", that's not proof is it?

I wrote an aggrieved letter to Chris Tarrant at Capital and sent it off today, copied to Richard Park, Group Director of Programmes. I suppose they'll just lie as usual. Bastards, basically.
.....
The solution is surely to not have a TV, video, radio or telephone in the house, Mike. That way they can't be used to watch you.

>The solution is surely to not have a TV, video, radio or telephone in
>the house, Mike. That way they can't be used to watch you.

No. I tried that strategy in 1990/91 when I sold my television and stopped
listening to the radio. It didn't work because they got at me through
co-workers and eventually the general public.

The solution is to gather evidence by recording everything, and then complain
or sue if possible. I wish I'd recorded it all five or six years ago, then I
might be more successful in a legal action now.
.....
Did anyone else watch the X-Files on Sky last night (Sunday 13th April) and
recognise Mike's symptons in the chap with the tattoo? It was quite
interesting to see someone responding in precisely the same way, picking up
on individual words and phrases in ordinary sentences and applying parts to
themselves as though they were intended.

Not a pleasant ending though. You take care, Mike, and keep taking the
medication. uk.misc just wouldn't be the same without you now.

>moments after switching on the DJ starts talking about "psychotic", that's not
>proof is it?

No, it isn't, but you knew that anyway.

Mike, how is it that you think that this can't be a coincidence because
it happened 'moments' after you switched on the radio? Haven't you just
told us that you haven't heard a thing for two weeks? Going two weeks
watching TV & listening to the radio without a reference to 'mad', 'crazy'
or 'loony' is quite an acheivement, especially given the trashy radio you
seem to prefer.

I've just spent a lot of the weekend trying to keep a manic depressive
under control, so that she doesn't have to go back into hospital and
lose the last few months' memories to ECT. One thing I've noticed is
that manic depressives almost seek to foster their fantasies, they
enjoy the control and the high. You seem to be the same - you refuse
to answer the points put to you that explain away what you call persecution
totally - do you have the courage of your convictions to reply to this?
Or do you enjoy the attention your illness brings you?

Mike Corley wrote:

> Something mildly unusual is happening. Nobody has been getting at me for the
> last couple of weeks.

Do please tell the *truth*. It has been longer than *2* weeks as I'm sure
you have noticed, hasn't it ?

Well I claim responsibility for the absence of persecution. When I rang
John Major's personal private secretary, not the personal political one or
any of the others in the same office, and I said you would vote for the
Conservative Party at the General Election the secretary said Johnny would
be so happy and as a sign of gratitude he rang-up the Head of MI5 and told
them to save money for tax cuts by abandoning forthwith their campaign
against you. Consequently MI5 and MI6 have been able to redeploy urgently
needed resources (i.e. manpower and telecoms interceptions) against an
international band of (*****censored*****).

On behalf of the law-abiding and decent citizens in the British islands, I
would like to sincerely thank you for your invaluable contribution to
crime fighting by your instrumental achievement in releasing badly needed
and very scarce MI5 and MI6 resources.

Many thanks,

Please don't forget it is National Election time and the news broadcasts
at 21:00 on BBC1 are preoccupied with British politics.

> Of course, I should have video-taped the news programmes back in 1990/91/92
> (and even 93) when it was still all going on.

Any particular date in mind ? I have a few in the library. You can also
purchase copies from the BBC on 0181-743 8000 (central switchboard).

> Anthony Johnsson (casually name-drop to stick the knife in) will tell you how intelligent
> a person I am, yet I didn't have the good sense to record the programmes at the time,
> and it's a bit late now.

Perhaps it is for the best. Now that it is all over, you can return to
Canada. Did you manage to get your Canadian citizenship ? What did your
contracts at MI5 say about you becoming Canadian ? You never did mention
the name of your MI5 liaison officer nor of any of the others.

That's true. But as it is now all over there is no need to worry about
the past. MI5 said your file has been removed from the Registry and put
in a burn-bag so there is nothing left for anyone ever to find.

By the way, what was the URL of your famous Corley web site ?

I have to admit that it is actually mildly amusing to have newsreaders watching
you, although it is tiresome after a bit. I am currently in an interesting
situation, because after my lawsuits against them I think the BBC newscasters
have stopped watching me entirely; I also think that ITN, in particular John
Suchet, *are* still watching but they're being subtle about it (his blink
pattern followed mine).

Being called nasty words is quite horrible though, and seems gratuitous; what
do they gain by it, except to exercise their sadism?

: >I think we all ought to remember that schizophrenia is a

You have. They're not pleasant atmospheres, especially the secure wings,
which have more in common with prisons ('airlock' doors, list of 'banned'
articles, continuous observation). They have to be that way, unfortunately.

>Uh-oh. Peak Practice slagging you off as well now, eh Mike?

You better believe it. Tuesday's episode had one of its characters being
labelled as a "lunatic" with "something wrong with them". I changed channels
rapidly at this point, but in retrospect perhaps I should have carried on
watching and taped the program.

A few days ago I bought a video recorder (about time too) for evidence
gathering purposes. But strangely the TV news (both BBC and ITN) haven't
uttered a sound over the last few days. Almost as if they know they're being
taped...

>
>You better believe it. Tuesday's episode had one of its characters being
>labelled as a "lunatic" with "something wrong with them".

And?

There are many characters in TV programmes who _are_ lunatics with
'something wrong with them'. Why do you think this alludes to you?

In the eponymous book, Cervantes' Don Quixote is described as 'crazy'
'mad' and 'lunatic'. Do you think this is a reference to yourself,
albeit written by a time-travelling 17th century Spaniard?

If you accept that the character of Don Quixote can be described thus
without it being a reference to you, what problem do you have with
Peak Practice? Or do you enjoy tilting at your own little windmills?

A friend's lodger has turned out to be paranoid schizophrenic. Her
obsessions are strikingly similar to yours, she is convinced that she
is being bugged, and that students at her college are making fun of
her for being foreign. She has been looking for the services of a
private detective. Maybe Oxford has this unfortunate effect on foreigners?

I must say that I'm surviving rather well, or that's what the man
under the stairs told me yesterday.

Cross-posted to:
it.comp.console,pl.comp.bazy-danych,pl.comp.lang.delphi.bazy-danych,alt.religion.angels,rec.radio.amateur.boatanchors

Victor Lewis-Smith has broken the silence in his TV review column "Goon and best forgotten" in the Evening Standard (on Thursday 8/May). He said, "If I sound paranoid, that's probably because I once worked there. Eventually, I had to leave because they were all trying to kill me but, for sheer pathological hatred of the Corporation, I couldn't hold a candle to Spike Milligan".

I take this to be about me, because recently I wrote to both the BBC and Capital Radio, saying "I believe the current purpose of the harassment is to force me to kill myself to prevent the harassers, yourselves included, from being brought to justice, and last year there were several incidents of people shouting 'suicide' at me, which would appear to corroborate that view." I think VLS's words about the BBC "all trying to kill me" shows he has seen or heard of what I sent to the BBC or Capital.

Nasty eh? I believe that VLS or his mates read this newsgroup. I wonder how he would explain his article?

Erm, Mike, I'm a bit of a fan of Victor Lewis-Smith, ever since his days of "BuyGones". I must admit, he often likes to play the flawed lunatic evil nasty person. He's been doing it for years, with prank calls, far

before your illness. Its his act. He wouldn't be VLS without it.

He doesn't like the "Goons" either. It isn't about you.

>I take this to be about me, because recently I wrote to both the BBC and
>Capital Radio, saying "I believe the current purpose of the harassment is to

>VLS's words about the BBC "all trying to kill me" shows he has seen or heard of
>what I sent to the BBC or Capital.

I don't think Victor Lewis-Smith has worked for the BBC (or Capital) for several years (1994 was the last time...), so the connection, is paranoia here.

Personally, I believe VLS as a person of reasonable integrity, who wouldn't give a fuck about you...

>Nasty eh? I believe that VLS or his mates read this newsgroup. I wonder how he
>would explain his article?

Keep up the medication, not as many people read this newsgroup as you think, even though you are now incorporating that into your illness.

Victor? Are you there?

Newsgroups: uk.misc
Organization: Toronto Free-Net
Summary:
Keywords:

>Last night (21/Feb/97), I was listening to BBC GLR. You have to understand that
>I was listening by stealth. Back in 1990 I used to have Capital blaring out of

Not much changes. Today I was listening again to David Hepworth's show on GLR,
having more or less waded in on it by accident. Here is the exchange;

David: "we have executive drivetime, we have Brian in charge of the prize
cupboard. Brian it's not a bad prize cupboard this week is it?"

Brian: "no David it's an absolute (EMPHASIS) embarrassment (END-EMPHASIS) of
prizes this evening" (laughter)

David: "what have we got?"

Brian: "well in my left hand alone we've got that .... Gary Clale, I don't know
if you remember him obviously still alive and kicking...."

David: "Rock and roll spelling test is your first opportunity to take advantage
of this embarrassment of prizes"

What do I read into this exchange? The laughter after the word "embarrassment"
shows they're aware of the last complaint I made on usenet (copied by
snail-mail to them). The "left hand" business is I think a coded way of calling
me a w***er (the term would be better applied to Brian and David).

I have a tape of this exchange, and will eventually get around to posting it on
the website.

2501. MI5 Persecution: Overview (578)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-08-20 19:48:19 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07072019481683@4ax.com>
Source record: 7048
Cross-posted to:
it.comp.console,pl.comp.bazy-danych,pl.comp.lang.delphi.bazy-danych,alt.religion.angels,rec.radio.amateur.boatanchors

Overview

What all these snatches of video and audio, and newspaper articles, have in common is that none of them provide conclusive or very convincing
evidence of their being directed against me, or forming part of a campaign against me. Other people with my illness doubtless could produce similar
non-proof if they were minded to do so.

Good, now we've got the disclaimer out of the way, we can describe precisely what it is that is on display in this part of the site. In the video
section, we have Quicktime (MPEG-4) clips of Jon Snow of ITN in action, also interviews with Ken Clarke and John Major of the ousted Tory regime. These are
embedded in the page using QuickTime. While each audio/video clip is coded to automatically download the QuickTime player, you may find it helpful to
download QuickTime from Apple's website before you start viewing the media files.

Note that each item is awarded a rating of the confidence I feel that it is directed at me, expressed as a percentage. Items with 50% or
more are probably about me; 100% indicates a "dead cert".

In audio we have MP3 files of harassment at work in Canada in late 1996, also GLR's David Hepworth not even trying to pretend that he isn't getting
at me, and a snippet of Capital. There is also an album track which I have taken as being about me. The newspapers section contains articles by Bernard
Levin on his encounter with a madman who "bursts into tears, and swears it is all
true - and it is". Also a Private Eye cover, and snippet from Victor Lewis-Smith.

I have added several recordings of abuse "in public". By Sept/1998 I had seven minidiscs of such recordings, unfortunately containing mostly very
nasty sexual slanders which I will not be publishing on this website. The recordings were made on a Sony Minidisc Walkman MZ-R30, which I purchased
in Canada in July/1997, with ECM-T140 microphone. After both the MZ-R30 and the microphone reached the end of their lives, in June/2001 I purchased as
replacement my current recording gear, an MZ-R900 walkman with ECM-T145 microphone.

Share and Enjoy! I hope you enjoy partaking in my delusions which have been recorded with high fidelity digital equipment and presented for your
listening pleasure.

Ken Clarke (1), April 1997

Certainty level: 30%

The first of two video segments from the same program, this shows
Jon Snow interviewing Ken Clarke in April 1997, during the general
election campaign. The following exchange is heard;

Jon Snow: "You say we are booming in your posters, the bust's around the corner"

Ken Clarke: "You took that from three years ago, when I was being
advised to do all kinds of mad things to stimulate the economy,
and being told that I had to take desperate measures to get it going"

At this time I was watching television almost continuously at home,
with a video recorder whirring away, trying to obtain from the
newscasters a reaction which would give them away. I think this is an
instance where it happened. Ken Clarke first darts a glance straight at
the video camera (and perhaps at a monitor next to it showing my living
room), then comes out with "all kinds of mad things", while engaging in a
facial display involving raising of eyebrows and lowering of eyelids.
To me at the time, and also now, it looked as if he was selecting a
context into which he could drop the word "mad" as a directed insult against me.

Ken Clarke (2), April 1997

Certainty level: 30%

The second of two video segments from the same programme, this shows
Ken Clarke during the election campaign. He makes the following statement;

"we have a party, and we have a Cabinet which has produced a manifesto
consistent with our policy of the last five years;
people are challenging us on the basis there's been some monstrous
conspiracy between all the politicians to guide us we know not where,
we know where we're going, we wish to be a leading influence in the European Union"

It should be fairly obvious what I read into in the above sentences.
The "monstrous conspiracy between all the politicians" could of course
apply to the public perception of closer European integration, but
I took it as referring to the conspiracy of politicians and
media people against me. Again, facial expression comes into it; as Clarke
speaks of the "monstrous conspiracy" his eyebrows twitch and it is clear
that something or somebody is being made fun of.

2504. MI5 Persecution: Dimbleby / John Major, April 1997 (4247)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-08-20 20:37:45 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07072020374143@4ax.com>
Source record: 7051
Cross-posted to:
it.comp.console,pl.comp.bazy-danych,pl.comp.lang.delphi.bazy-danych,alt.religion.angels,rec.radio.amateur.boatanchors

Dimbleby / John Major, April 1997

Certainty level: 90%

Dimbleby interviews John Major during the election campaign. Here is
the exchange, regarding Neil Hamilton, the "sleazy" Tory candidate;

Dimbleby: "It's a direct quotation from what he said to Sir Gordon Downey
and what he said to his local newspaper, the Knutsford Guardian".
Major: "Well, heaven forfend that I should doubt what the Knutsford
Guardian actually said"
Dimbleby: "Well I should hope so"
Major: "Absolutely, it would be quite unforgivable to doubt the
Knutsford Guardian"

What I find in this segment is an assonance between "Knutsford" and "Nut"
or "Nuts". I think Dimbleby deliberately invents the play on words,
and says it clearly enough for Major to pick it up and repeat it.
You can gauge Dimbleby's intent from his facial expression of false
honesty when he uses the words "Knutsford Guardian"; and Major's reaction
follows from his recognition of Dimbleby's intent; Major smiles and says
it would be "unforgivable to doubt the Knutsford Guardian".
These are much clearer on the original video than on this Quicktime clip.

Channel Four TV News - 12/Feb/1999

Certainty level: 100%

I am positively, utterly, completely sure this item is about me. It's a bit subtle so the objective reader might not understand my certainty. Here is
what happened. I was watching Channel Four News with Jon Snow, on the day Clinton "got off" (as it were) in the Monica-gate scandal. Snow said;

"[and we're anticipating that the President himself will make his] first comments after the trial in which he has now been cleared at around half-past seven. So we'll have more on the historic judgment, we'll also be considering [starts smiling] the winners and losers in this whole sorry saga. Now further doubts have been...."

When Snow said "half-past seven", I looked at the clock on the mantelpiece above the TV. Snow saw my glance, and in reaction to my glance at the clock,
smiled. I think he was smiling at what he perceived as my self-importance.

Usually when newscasters or radio presenters laugh at me, there is an excuse for their laughter; usually they manage to find some reason for my
being "funny"; their amusement is blamed on me; it is my "fault" they are laughing. And so it was with this instance; Jon Snow thought it was funny
that I should be so interested in seeing Clinton, and his half-smile while reading the words "winners and losers" expresses that.

I wrote to Snow at ITN shortly after this broadcast to ask him about his behaviour; of course, he didn't reply.

Cross-posted to:
it.comp.console,pl.comp.bazy-danych,pl.comp.lang.delphi.bazy-danych,alt.religion.angels,rec.radio.amateur.boatanchors

Chris Tarrant - 10/March/1999

Certainty level: 25%

This one might be aimed at me, or it might be tinged with a whiff of intent, although I only give one chance in four for Tarrant's thoughts being aimed
at me when he said this. During his "Who wants to be a Millionaire" TV show in March 1999, he said;

if you're watching the show jumping up and down screaming at the telly,
remember you could be here. You can either seek professional help or call us...

The background is as follows. In early March I'd sent a quantity of emails to Capital FM, the London radio station where Mr Tarrant has his breakfast
show. They were addressed to the email account which Mr Tarrant used to read emails posted on Capital's website. Capital objected to the quantity
of emails - in fact, they contacted the Metropolitan Police's Computer Crime unit, who, in turn, "felt my collar" by giving me a verbal warning
over the phone to cease this behaviour.

The emails contained the words which I had heard Mr Tarrant speak in early 1994, namely;

"You know this bloke? He says we're trying to kill him.
We should be done for attempted manslaughter".

At the time of writing (May 1999), the Police have not told me what aspect of the emails was "illegal", nor despite my repeated urging have they
questioned Mr Tarrant about his remarks from 1994.

Regarding the clip from Tarrant's show above. The Police spoke to me on the afternoon of Wednesday 10 March 1999. Tarrant's live show went out
that same evening. The Police have told me that after speaking to me they told Capital FM that they'd spoken to me regarding the emails. So Tarrant
would have known by the time of the show who'd sent the emails and why.... and it's quite possible that his remarks about "seeking professional help"
were aimed at me personally following my attempts to persuade him to own up to his 1994 remarks.

Thanks so very much for this compilation! Really generous of you! Saved!

Normally I'd have searched & looked myself, although I wouldn't have known
what they were called; however I was in the middle of working a 4 day weekend,
and just thought to ask here after seeing them mentioned OT in a thread
tangent in rec.audio.tubes (as "11 pin octal") and asking there.

I've just received a reply there too, suggesting yet another source, FYI, in
<41gic397qanpk206m3clshsp27ithnigdk@4ax.com> in case anyone else is looking.
(http://www.radiodaze.com/ under "Vacuum Tube Shields, Plugs & Accessories)

I have yet to fire up either unit, bought s/h at auction, although I am assured that they work, albeit needing some chassis restoration on the FTV-250, and some attention to the finals & HT caps on the FTdx400...!

Regards, & thanks again for so kindly providing this info!

Well folks, since I have been licensed since '56 I know all about those old rigs. As it is, I do not own, nor will I buy any modern equipment, even today. I have mostly all Drake gear, and a set of Kenwood twins. It is the later version (T599D and R599D), but they still have three tubes in them. I can still remember my first transmitter that was my Christmas present in Dec. of '56. A brand new Heath DX-35. I used a 1937 Hallicrafters SX-11 that cost me $15.00. I had done WAS with only three crystals by the time I graduated HS in '57 and joined the Navy. I still like the wait for the rigs to warm up, keeps the shack warm in the winter and has that great smell of burning dust off the tubes from time to time. We didn't even know what SWR was, and had no way to measure it if we did. Use the handbook for your measurements, cut the wire and build and antenna. If I remember right, I even used RG-11U for a feed line, not knowing any better.

Yeah, keep 'em glowing... Plug-N-Play is not for me!

As I recently became retired my interests have evolved towards building homebrew tube gear. Reasons: i) simplicity in circuitry, ii) comparatively large tubes & sockets make soldering easier, iii) accidental slip of the test prod might not kill a tube but might a transistor, iv) yeah, I like to see those filaments glow, too, v) can still get those tubes but some transistors you can't find anywhere, v) throw-away technology (boards) is bad ecology...give me discrete devices any day, and vi) with high power heat sinks, silicon compound for conduction of heat (if it gets on your fingers, its hard to get it off) is needed and that damned metal can getdamned hot.

I've been building a tube SSB transmitter for about 1-2 years now (parts of it can be seen at http://www.panix.com/~asd) and ends up with a pair of 813s in grounded-grid, driven by a single 811a in G-G, lots of home brew antenna tuners, and Icom 707 for the moment SSB transciever.

The homebrew SSB exciter lineup is not yet pictured, but at its current stage of construction is almost ready to go on the air. Generate DSB at 2 mHz with 6AL5 balanced modulator, upconvert by mixing with 7 mHz to 9 mHz (6BE6), use McCoy 9 mHz crystal filter (somebody gave it to me 25 years ago) to shave off the desired sideband, mix (6SA7) with 5 mHz local oscilator (by doubled 2.5 mHz from old war surplus Collins 70H3 VFO [from Fair Radio Sales when they had them, they ran out years ago]) to get 4 mHz (75 meters, my favorite ragchew band) which the scope shows to be about 5-10 mv, and goes into two 6C4s (triodes, grounded cathode) and then into a 6AG7 & 6146. I am at the point where I need to make a RF transformer

to take the output of the 6146 to drive two more 6146s in parallel to get the ten watts I need to drive the G-G 811a. Yes, if I could optimize everything better, I could use less tubes. But, I preferred to make modules (lots of stages are built inside of old computer power supply cabinets (they are about 6x6x4 or so, and nice to work with, cheap at hamfests at $1 each or so). All the gear is full of those old D'arsonval "Frankenstein"-type (real) meters (not this LED crap), so I can keep monitoring practically all the voltages on anything. Its not very pretty to look at, but its a whole lot easier to work on than any of that new gear out that surely has thousands of transistors and hundreds of chips (?).

I chose the 813s and 811 and GG amps because both the 813 and 811 don't really need cooling fans (I hate blower/fan noises) and grounded-grid amps are notoriously stable (no neutralization headaches), and they are pretty cheap. I have several 813s, some made in China; one of the Chinese 813s had a filament that opened up on me all by itself after very little use (don't know if that is THEIR quality control or just a statistical fluke, but I thought I'd pass that along to y'all). I also manage filament warmup and cooldown on the 813s with a variac (up and down over abut 5-10 seconds), but not on the 811 amp. Been using the 813s + 811 for over a year (using the Icom 707 as driver) and just love how nice and quiet it is without fans/blower noise.

Almost all of my old rigs are also pictured on that URL, and a couple of pictures of my "secret lab" out in the garage (heated with a space heater in the winter, cooled with a small airconditioner in the summer).

I started as a novice in 1959. Had a Knight kit T-50 and Knight R-100 receiver, later got a DX-40. Mostly liked to ragchew with locals on ten meters AM at the time. Lots of find memories. Lots of SWLing.

I'd like to hear from other homebrewers, HFers, ragchewers and learn if ther are any 75 meter nets for homebrewers/tubers/etc. I look at all this new gear coming out (for thousands of dollars) with hundreds of buttons, knobs, and "thangs" on them, and big thick manuals you have to read to figure out how to push the buttons (once, press twice, press and hold?, press and hold one, then turn on the power switch? Etc? Secret "reboot" buttons hidden somewhere. Built in DRM, DCMA, spyware? Too?). What happened to old-fashioned skill? 50 years ago guys worked the world with a crystal and a single 6L6 and straight key. Now, they are all couch potatoes in front of a black box that looks like its from outer space. ;-)

I figure I'm within a week or two of getting the homebrew SSB exciter actually on the air. I've been testing the outputs of various stages either using the Icom 707 as general coverage receiver, one or two oscilloscopes to check generated signals, etc. Still have a lot of tweaking to do. Its been a ton of work, debugging and rebuilding when something doesn't work, but its also been an incomparable sense of accomplishment, too, when I get a stage to work and make progress (four steps forward, three steps backwards). Its also nice to have some test equipment (generators, meters, a good oscilloscope [had a Tektronix 922

that gave up and I tossed, then a heathkit which had a dead vertical amp that I fixed, and a BK-1420? very nice but now the horizontal sweep died but vertical amp still good, so I can probe at least for RF which gives me a vertical line [keeping the test equipment going is also a problem], and all of that stuff is also 30+ years old).

After that, I plan to build a tube receiver and maybe even build a crystal lattice filter, and try to build a stable VFO.

2512. FS TenTec Corsair II

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-08-22 19:57:52 UTC
From: Charlie Hugg <k5mbx@sbcglobal.net>
Message-ID: <1z0zi.811$YQ.256@nlpi061.nbdc.sbc.com>
Source record: 7059

I have a TenTec Corsair II for sale. It is in very good cosmetic condition with only a few minor scuffs and scrachtes on the cabinet and trim. The Front Panel is nice. The frequency readout is bright and clear and the VFO works good.
The rig takes about 30 minutes of warmup then it is very stable. It receives very well, but I only get a max of 50 watts output. Probably needs some adjustment on the ALC or Power Amp. I don't have a manual. I have been using it on my TenTec 260 Power Supply, so don't have a seperate power cable.
Price is $350 plus shipping from 79602. Thanks, Charlie Hugg, K5MBX

Don't need any 55's - have a pile. Fair Radio has used 68s for $5.00
each if that helps...

best regards...

Those have a narrow viewing angle, which would be ok if they were used for indicator lamp assemblies. You want a wide viewing angle for backlighting meters and dials.

After trying LEDs, and finding the light was too focused, I wound-up just using grain-of-wheat lamps (from the local model supply emporium) when relamping my new-to-me TS-130S. Then, a friend (service manager for a sound equipment company) said, "Just file/grind off the lens on the LED... the light will be a bit dimmer but spread over a wider area." I intend to do that the next time around.

If using incandescent lamps, you can also use a current source or varistor to limit the inrush current, and extend the life somewhat.

Bryan WA7PRC

2520. MI5 Persecution: Chris Tarrant - 10/March/1999 (578)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-08-25 05:55:12 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07072505551677@4ax.com>
Source record: 7067
Cross-posted to:
it.comp.console,pl.comp.bazy-danych,pl.comp.lang.delphi.bazy-danych,alt.religion.angels,rec.radio.amateur.boatanchors

Chris Tarrant - 10/March/1999

Certainty level: 25%

This one might be aimed at me, or it might be tinged with a whiff of intent, although I only give one chance in four for Tarrant's thoughts being aimed
at me when he said this. During his "Who wants to be a Millionaire" TV show in March 1999, he said;

if you're watching the show jumping up and down screaming at the telly,
remember you could be here. You can either seek professional help or call us...

The background is as follows. In early March I'd sent a quantity of emails to Capital FM, the London radio station where Mr Tarrant has his breakfast
show. They were addressed to the email account which Mr Tarrant used to read emails posted on Capital's website. Capital objected to the quantity
of emails - in fact, they contacted the Metropolitan Police's Computer Crime unit, who, in turn, "felt my collar" by giving me a verbal warning
over the phone to cease this behaviour.

The emails contained the words which I had heard Mr Tarrant speak in early 1994, namely;

"You know this bloke? He says we're trying to kill him.
We should be done for attempted manslaughter".

At the time of writing (May 1999), the Police have not told me what aspect of the emails was "illegal", nor despite my repeated urging have they
questioned Mr Tarrant about his remarks from 1994.

Regarding the clip from Tarrant's show above. The Police spoke to me on the afternoon of Wednesday 10 March 1999. Tarrant's live show went out
that same evening. The Police have told me that after speaking to me they told Capital FM that they'd spoken to me regarding the emails. So Tarrant
would have known by the time of the show who'd sent the emails and why.... and it's quite possible that his remarks about "seeking professional help"
were aimed at me personally following my attempts to persuade him to own up to his 1994 remarks.

it.comp.console,pl.comp.bazy-danych,pl.comp.lang.delphi.bazy-danych,alt.religion.angels,rec.radio.amateur.boatanchors

Nicholas Witchell - 10/April/1999

Certainty level: 100%

This clip is of Nicholas Witchell reading the BBC2 evening news at 7pm on Saturday 10 April 1999. You have to understand that the psychopaths of
the Security Service consider their abuse of me to be "so funny"; and central to their persecution of me is their inducement of their "bought
journalists" like the BBC's Nicholas Witchell to laugh at me on television.

So in this clip we see Witchell smirking and grinning while he reads the news. Only part of the news broadcast is shown in the clip; preceding it,
Witchell's upper lip quivers in mirth for several minutes, until his entire mouth twists into the uncontrollable smile shown in this clip,
through the excuse of a weak non-joke about sports fixtures.

Gee, two years ago I bought a mint Corsair II with power supply on
EBay for $500 with all filters and working perfectly. They've gone
down a bit in price since.

Your rig probably needs final amp work, if not new finals, plus a PTO
rebuild. For $450? I think not.

BTW, why on this newsgroup? It's hardly a boatanchor.

it.comp.console,pl.comp.bazy-danych,pl.comp.lang.delphi.bazy-danych,alt.religion.angels,rec.radio.amateur.boatanchors

"England expects every man to do his duty"

Certainty level: 90%

This video clip portrays a fairly-certain case of unpleasant MI5 harassment; because of context, surrounding events,
not just this one happening. It's the first time an MI5 agent has been caught on video, and, presumably to their chagrin,
their paid agent is either engaging in an onanistic practice, or, more probably, pretending to do so, in order to
carry out an act of harassment.

The background is as follows. In late June 2000 I had posted the following message to Usenet, about MI5's making
obscene noises at me on several recent occasions;

>From: bu765@torfree.net (Mike Corley)
>Subject: relax, don't do it (mi5 again)
>Date: 22 Jun 2000 00:00:00 GMT
>
>you will recall that a couple of weeks ago I was supposing what MI5 were
>doing with their 'single'handed' posting antics at 2am
>
>exciting stuff
>
>so about a week ago someone rings me up at home.... 'is that Emmanuel
>Goldstein?' then he phones back the following day and goes 'huaaaagh' on
>the phone before dropping the handset in excitement
>
>and a day or two later, just coming out of our house to put something in
>the rubbish bin, a pair of blokes over the other side of the road, again
>start making orgasmic noises
>
>I'm not paranoid enough to record minidisc when I pop out for a few
>seconds...... but perhaps I should be

The video clip, which was captured on 1/September/2000, is the culmination of that thread of harassment. You
have to understand that MI5's abuse is in threads; they choose a topic, and then continue with it for months
and years. Sometimes they drop a topic, usually to be replaced by a worse one, and you never hear of it again.

If the person in the video clip were not an MI5 agent, then he would deserve privacy, despite carrying out a real
or feigned act in a public place. But I am almost 100% sure, because of context, that this man was one of their
operatives, which removes any consideration of privacy from his act. He is facing away and cannot be clearly
identified from this clip. I've never seen this man before or since, but that is true of most other such incidents.

it.comp.console,pl.comp.bazy-danych,pl.comp.lang.delphi.bazy-danych,alt.religion.angels,rec.radio.amateur.boatanchors

C4 SnowMail - January/2001

Certainty level: 50%

In January 2001 I signed up for Channel 4 TV News's email service SnowMail, under an anonymous email address.
Quite soon Jon Snow and others started getting at me in the SnowMail bulletins, so I promptly unsubscribed.
Here are three distributed messages which may be intended to be against me; I have given these items a joint
probability of 50% only, since it is quite difficult to be sure these are against me, although I think they
may well be.

First item is from 5 January 2001. "Back passage contacts" might genuinely be about Labour were communicating
in a shielded way with ITN; but it may be about Snow's covert communications with me on his programme and in
this bulletin; and it's a slightly strange thing for him to say, it suggests the human body's back passage.
"I wish they'd come and talk on our website".... Snow knows I'm subscribed to his mailing list, and he may be
encouraging me to talk to him by email; again, if that comment were genuinely about Labour, then it would be
a strange thing to say, since the politicians talk to Snow by phone and on his programme, so they wouldn't talk
to him by email; my suspicion at the time is that he was trying to persuade me to talk to him by email,
so he could decently lie that my thoughts of reference were incorrect.

Subject: Channel 4 News briefing
Date: Fri, 5 Jan 2001 17:15:06 -0000
MIME-Version: 1.0

January 5, 2000

Good afternoon dear viewer,

Well the 'snowmail' drew a little ire from Labour HQ yesterday. A sensitive call at 6.35pm from my friendly
mentor there sought to correct the impression I gave in yesterday's missive that in some way Labour was bounced
into naming these latest millionaire donors. Well I'm afraid they were...rest assured Paul

Hamlyn would not have
been named without the diligent sleuthing of my colleagues, and had HE not been named neither would these latest two.

The only serious inaccuracy I must plead to was the promise that we would put these matters to a 'senior Labour
person'...alas none was forthcoming...I shall make no such rash promise again. My same mentor was on the phone again
during last night's Channel 4 News urging us to 'get some reality into the programme'. I fear we may have touched a
sensitive nerve...and the election campaign has not even started, or has it? I shall try to keep you posted with these
'back passage contacts' as the campaign unfolds..from all sides. I do wish they'd come and talk things over with all
of us on the web site...here's an open invitation...

So to today:

Harold Shipman murdered as many as 250 people it now turns out. But he is never to be tried and relatives who seek
closure to their uncertainties will never reap satisfaction..we have the DPP, the Chief Medical Officer and a solicitor
for aggrieved and bereaved families on the programme..the world's second-worst mass murderer..can he be allowed to
escape further action?

Sending private/sexy emails in company time gets workers the sack..Big Brother spies on office premises..is electronic
life in the work place getting out of hand? We explore what we can...and if you are not sure what you can and can't
send, our site spells out the legal dos and don'ts and gives you the chance to put your views to us.

The CIA publishes its risk assessment for the world in the coming years..beyond the CIA itself, what's the biggest
threat to life and liberty? Find out on Channel 4 News..and a major encounter with a man expected to take a top job
in the Bush administration...

And a sumptuous piece from Nicholas Glass in Valencia..a city transformed by a brilliant young architect for half
the price of what the Dome cost us.

Lots moving, see you at 7.00,best as ever,

Jon Snow

The next contact was on 11 January, with the unsubtle words "the lunatics have taken over the newsroom"
from Krishnan GM. The phrase needs no explanation as to why it might be a dig at me.

From: "Guru-Murthy C4N, Krishnan"
Subject: Channel 4 News briefing
Date: Thu, 11 Jan 2001 16:56:25 -0000

MIME-Version: 1.0

January 11, 2001

Good Afternoon. Jon's away so the lunatics have taken over the newsroom. I am joined by Samira for tonight's show.

The Depleted Uranium confusion deepens. What did Ministers and senior officers know about the risks to soldiers?
What did they tell others? And why the lack of candour over the recent documents that have surfaced? Having
dismissed the army report leaked yesterday warning of the dangers of exposure to DU as written by a trainee and
littered with mistakes, the Ministry of Defence now accepts it was written by an experienced officer.
But they won't say who. More awkwardly it emerges that senior officers decided a month after it was written that
the report should be circulated to all personnel likely to come into contact with DU. But was it? Nobody seems to
know. Our Science Correspondent Andrew Veitch has also visited the lab in Oxford that could begin testing
veterans for Depleted Uranium within six months, but they have had no contact from the government as yet. From
the Tories, Mr Duncan Smith is likely to join us. And we have Defence Secretary Hoon coming into the studio to
answer the obvious (and not so obvious) questions.

No interest rate cut today from the Bank of England, but could it be next month? As real fears are raised about
the likelihood of recession in the US how could it affect us over here? There's been a recent consensus that
Britain could weather the storm instead of falling into the usual pattern of shadowing American trends. But how
realistic is that? And what about all that inward investment we rely on from the States? Liam Halligan has been
looking at just what impact economic downturn across the water would have on us.

The former Bosnian Serb President Biljana Plavsic pleaded not guilty to charges of warcrimes including genocide
today. She was number two to Karazdic and a reputed hardliner during the "ethnic cleansing" of Bosnia.
But has a deal been done on her sentence if found guilty? Just why did she get on a plane and give herself up
to the Hague War Crimes Tribunal? Nobody seems to have any explanation. Her lawyers are asking for special
accommodation and even the possibility of bail. Gaby Rado is there and joining us live is the first Prosecutor
in the Hague Judge Goldstone to discuss whether plea bargains and deals are the only way to get the real villains.

Also the astonishing news that scientists in America have bred the first genetically engineered monkey. What will

they be used for and what's the next step? Does anybody really believe they won't do it to humans before too
long? Julian Rush will have details.

All that and loads more at seven. See you then, I hope. Krishnan.

The third and final item is from 24 January, shortly after which I unsubscribed from SnowMail. Again, it is difficult
to be sure if this item refers to me; it may do, it may not do, 50% captures the possibility. Snow refers to
"third leg of [Blair's] political footstool". In English culture "third leg" indicates one's male member;
Snow's phrase may be a sexual reference, of which there were others around that time.

From: "Snow C4N, Jon"
Subject: Channel 4 News briefing
Date: Wed, 24 Jan 2001 16:37:36 -0000
MIME-Version: 1.0

January 24, 2001

Good evening dear Channel 4 News viewer,

There are times in this business when you suffer severe attacks of deja vu...haven't I already said "Mandelson
Resigns!"...I'm afraid I have, and tonight I shall say it again. He's gone, the fat lady has not only sung but
died completely and utterly on his career...that is the end of the former Northern Ireland Secretary's political career.

It's a body blow against Blair for whom Mandelson was a mentor, manipulator, calculator, friend, brother and the
third leg of his political footstool.
It's a body blow for a Prime Minister who has had to have him resign not once but twice. It calls into question
Tony Blair's judgement. Mandy, probably one of the most brilliant spirits in politics, flew too close to the
sun...suffering finally at the hand of his own diabolical flaw.
Amazingly it's a flaw Blair understood more keenly than anyone...

And then there are the Hindujas who have compromised every political party with ridiculous photographed party
poses..who are they and how do they work?
Masses moving on all fronts on this story tonight. We have the resignation speech in full on our site www.channel4.com/news;
if you want to see how Mandelson bowed out.

There are other developments:

The cancer tragedy at Nottingham Queens medical centre..the wrong drug going into the spinal column of an eighteen-year-old
Leukemia victim who's now in intensive care, dangerously ill...it's happened before..why has it happened again?

And a moving interview with Sharon Sage who's mother Lorna Sage wrote a spell binding memoir highly rated in last night's
Whitbread Prize. An exceptional piece....

A highly political night....see you at seven on four...best, as ever, Jon

After this email I unsubscribed from SnowMail. I could not be sure that these items were or were not about me,
but it's an unpleasant feeling that Mr Snow might be getting at me in writing, as he certainly was when he watched
me while presenting the news; so I cut my losses, so to speak, and bailed out.

BBC-TV "See You, See Me" - 7/Dec/2001

Certainty level: 80%

On Friday 7 December 2001, BBC Schools aired a TV programme from their "See You, See Me" series.
The series was based in Scotland, with Grant Stott and Wilma Kennedy trying to find some stolen jewels.
Its web home is www.bbc.co.uk/scotland/education/seeyouseeme/

The programme appeared to make some "subtext" references to my situation. Kennedy refers to "it's not fair",
which is a key phrase; its existence started with OCTS MD Hugh S.-W. who humorously referred to my treatment
with the same phrase.
The subtle statement is that it is fair, because we're doing it, and we're always right, even when we're wrong.

The phrase "useless idiot" from the police chief is a clear insult directed at me, and needs no explanation.

But it is the third item in this clip which is most telling. Stott says the words, "humiliating in front of
the whole public, it would crucify us" if the investigation were called off. That's the phrase that assures
this clip of an 80% probability rating. MI5 are trying to humiliate me "in front of the whole public",
and their strategy is a mixture of ambiguous covert, such as this very programme, and clear overt.

Channel Four TV News - 10/April/2002

Certainty level: 80%

I was watching Jon Snow on Channel Four TV News on Wednesday 10 April, and he again reacted on seeing me
watching his programme. At 7.25pm he was reading an item on atrocities during the Balkan war;

JS: "It was Europe's worst massacre since the Second World War, and Dutch army officers [cough] and the
United Nations should share the blame. So says the first authoritative report into the murder of
thousands of Muslim men in Srebrenice at the height of the Bosnian war in 1995. The 7,500 page document
took Dutch Government researchers six years to prepare, and it condemns military and political leaders
for sending peacekeepers on a mission impossible. Our Foreign Affairs correspondent Gaby Rado,
who went to Srebrenice very soon after the massacre, is with us now. Gaby, how damning is this report?"

GR: "Well it is very severe. It accuses the Dutch Government of sending badly armed and badly briefed
Dutch soldiers into a very dangerous space out of a sense of national arrogance basically. It accuses
the United Nations basically of..."

There are two incidents in this one recording. The first (80% certainty) is when Jon Snow develops a frog in
his throat in the first sentence, shortly after reading the text "Europe's worst massacre". There is both
verbal expression and facial expression at that point; he is laughing at me, which is at odds with the serious
material he is reading. His eyebrows twitch upwards, and he is smirking at the phrase "Europe's worst massacre", and its application to the Security Service's actions against me. Another aspect
is that when Snow said "Europe's worst massacre", I facially reacted; in return, Snow would have seen
my change of expression, and followed it with his own reaction. He almost says "United States" instead of
"United Nations"; he isn't looking at his autocue, his mind is off what he is reading, instead he is looking
at me in the little monitor where he sees me through the television.

The first incident I'm fairly sure about, but the second I only give a 20% certainty to; it's when Gaby Rado
talks of a "sense of national arrogance", supposedly about the Dutch, but perhaps the English actions
against me for over a decade. If Rado's statement were about me, then it would be condemnatory of MI5
as being "arrogant"; but I cannot be reasonably certain it's about me, or much less so that Snow's
reaction in the first instance, anyway.

BBC1 TV News - 18/Dec/2002

Certainty level: 30%

This item occurred on Wednesday 18/December/2002, on BBC1 TV News shortly after 6pm. It is one of the "coincidence"
category of happenings, where people by supposed coincidence repeat exactly the words I have said or thought very recently.
In this case, the BBC's New York correspondent Stephen Evans, live from NYC, says the words "airy fairy language",
during a piece on Britain's entry in the competition for a successor to the WTC after 9/11.

I had been thinking the words "airy fairy" a day or two previously and may have spoken them in my sleep. I did not speak them awake.
The TV practice in 1990-92 had been to repeat on TV/radio (or at work) words which I had either spoken while awake, or words I had
thought but not said consciously - since I know that I sometimes say things in my sleep, but cannot later recall saying them,
obviously since I was unconscious at the time. The TV news reader or reporter then finds a context in which to drop a particular phrase;
this practice has a famous exemplar in the "Phil the Greek" item relating to the Duke of Edinburgh - who had been called Phil the Greek
in Private Eye, then a TV reporter managed to structure his report to include the words "fill the Greek community with alarm".
It might appear funny, but when such "intentional coincidence" happens a lot, as in 1990-92, and when it supports other methods of obscenity,
then the amusement value wanes.

The choice of words appears to form a homosexual reference - the way it works is that the Security Service are blokes fantasising continually
about another bloke, so to avert the obvious observation of their being gay
see here for another instance of unwholesome MI5 fantasising in public),
they try to assign the attribute to the victim - they do this sort of thing all the time, with all sorts of attributes. However, in this
particular case I give it only a one in three probability, since this incident seems to have been a one-off at that particular time.

2528. MI5 Persecution: Life is so hard (578)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-08-25 09:57:05 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07072509571194@4ax.com>
Source record: 7075
Cross-posted to:
it.comp.console,pl.comp.bazy-danych,pl.comp.lang.delphi.bazy-danych,alt.religion.angels,rec.radio.amateur.boatanchors

Life is so hard

Certainty level: 100%

This relates to harassment at my workplace in Canada. Yes, "they" had
their claws into my employers in North America, it doesn't just happen
in England, it happens here as well.

During the second half of 1996, at work, I was sitting near a co-worker
whom we shall call Mark (we can, because that's his name). This guy
occasionally came out with words and phrases that made me think that
"they" had got to him and were supplying him with information about my
home life (not social life please note, because of course I don't actually
have a social life here).

During November 1996 I tried to catch him in the act of saying something
"meaningful", a difficult exercise because as soon as he saw a tape
recorder, he shut up completely, except for times when he knew he would
be out of range of the walkman. (Note that the quality of this recording
is not very good; I was just using a four-year-old tape walkman with
a cheap microphone, quite low-tech).

During the evening of 12 November 1996, at home in my apartment (flat to
you UK-ers), I said "life is so hard, and then you die". A nihilistic,
negative thing to say, but quite distinctive. The following day,
13 November, Mark said loudly, "life is so hard eh, and then you die"
followed by loud laughter.

In my book the precise repetition of the words makes this incident a
100% certainty. You, the reader, may differ, but then living in a free
country allows each of us to have our own opinions, doesn't it?

Cross-posted to:
it.comp.console,pl.comp.bazy-danych,pl.comp.lang.delphi.bazy-danych,alt.religion.angels,rec.radio.amateur.boatanchors

GLR-David Hepworth (21/Feb/1997)

Certainty level: 80%

I was listening to BBC Greater London Radio (GLR) by stealth, ie. on my walkman with headphones, with the sound turned right down, to prevent anyone from hearing what I was listening to. Yet somehow "they" are still able to tell what station I am listening to on the walkman. After half an hour or so listening to GLR, DJ David Hepworth came out with this;

"I assume Brian, do we have an embarrassment of prizes in there, we do, don't we, absolute obscene amounts of prizes, there will no doubt be a riot at the back door, and that's A-level coming up after this"

The key phrases in what he said are, "EMBARRASSMENT of prizes", and what he himself emphasised verbally, "ABSOLUTE OBSCENE amount of prizes". It is my belief (based on content and tone of voice) that when he spoke these phrases he knew I was listening, and that the phrases refer directly to my situation. The "EMBARRASSMENT" is the embarrassment he and other media people would feel at having their wrongdoing exposed; the "ABSOLUTE OBSCENE" (which he verbally emphasised) described the disgusting sexual abuse which the harassers have been throwing at me.

Of course, I can't prove that this is what he meant, although this has happened enough times that it's hard not to recognise it when you see it. I sent David Hepworth a copy of this explanation, with the results listed in a subsequent item (David Hepworth 9/May/1997).

Cross-posted to:
it.comp.console,pl.comp.bazy-danych,pl.comp.lang.delphi.bazy-danych,alt.religion.angels,rec.radio.amateur.boatanchors

GLR-David Hepworth (9/May/1997)

Certainty level: 100%

This time I deliberately listened to Hepworth with the sound turned up on the radio, to try to get a reaction. Sure enough, he and his cronies reacted;

David: "we have executive drivetime, and we have Brian in charge of the prize cupboard. Brian it's not a bad prize cupboard this week is it?"

Brian: "no David in fact it's an absolute (EMPHASIS) embarrassment (END-EMPHASIS) of prizes this evening" (laughter)

David: "what have we got?"

Brian: "well in my left hand alone we've got that .... Gary Clale, I don't know if you remember him obviously still alive and kicking.... and that's just in my left hand"

David: "So it's certainly worth competing. Rock and roll spelling test is your first opportunity to take advantage of this embarrassment of prizes"

What I "read into" this item should again be quite obvious. Remember, I sent off a letter of complaint to Hepworth after his spying activity during the previous show. Here the emphasis on "absolute embarrassment" of prizes shows he knows this is a "key" phrase.

It might be interesting to try to talk to DJs like Hepworth and ask them what they get out of abusing their listeners. But if you challenge them directly, they show their true colour (yellow) by either not answering the challenge, or by denying that harassment has taken place.

Capital Radio (11/April/1997)

Certainty level: 10%

A nice easy one here. The DJ is heard to say (around 8.30pm);

"Jacko in town, what a gig it's going to be, that guy is amazing, and
psychotic, but amazing on stage, 0171-420-0958, on stage he's a madman
but he's wonderful"

I was listening to Capital loud and clear, trying to get a reaction.
The above may have been a reaction. I'm not sure if it was, and I'm not
sure that it wasn't.

Neil Fox's Juke Box on Capital Radio (week ending 15/March/1998)

Certainty level: 70%

Here is an excerpt from Neil Fox's show on Capital Radio 95.8FM, sometime during the week ending Sunday 15/March/1998 (probably during the weekend, but I don't remember).

First I will give the text of the conversation between Neil Fox and telephone caller Martin, then I will state my interpretation.

(conversation) (F=Dr Fox, M=Martin the caller)

F: coming up on the jukebox, the hotline's 0171-4848-958, just a quick shout here and so who's this going to be then Mr Producer?
(staff, shouting) MARTIN!
F: Couldn't quite hear you, it's going to be?
(staff, normal voice) Martin.
F: Thank you. Martin, hello.
M: Hello, Foxy.
F: How are you Martin.
M: Er, knackered.
F: Why?
M: Didn't get much sleep last night. Party down the road.
F: What time did you go to bed?
M: Four o'clock this morning.
F: Well that sounds quite a reasonable Saturday night if you ask me.
M: I was up at eight.
F: You were up at eight this morning?
M: Yeah.
F: That's sick. Why? What on earth made you get out of bed at eight this morning?
M: My father.
F: Well that's no good. Why is he being sicko, is he being a sadist?
M: No, he out there, sort of clearing room.
F: Listen, is your dad there?
M: No, he's downstairs.
F: Oh mate, can you get him?
M: No.
F: Does he not let you on the phone? The only reason is that I wouldn't mind having a chat with someone who makes anyone get up at eight o'clock on a Sunday morning. I'm sorry, that's ill isn't it, that's out of order.
M: It's sick.
F: I'm just going to ask around here. What do you think then, eight o'clock

Sunday morning? That's out of order isn't it, for any father?
(staff) Yeah, definitely.
F: Is he like victimising you or something, is there any reason why he wanted you up at eight o'clock? To clean your room?
M: Well as I say I got up at eight this morning to clean my room and it looks worse that it did yesterday.
F: Well I should have just left it and stayed in there until eleven o'clock if I was you.
M: Well I was up, I didn't get out of bed.
F: What, you didn't get out of bed at eight o'clock? No, he woke you up at eight o'clock. Did you do any cleaning at all?
M: I haven't touched my bedroom.
F: Top man. Boy you're going to get your arse kicked later aren't you. Now a song for you, what can we play?
M: Guns and Roses, "Sweet Child of Mine".
F: And we're going to dedicate this to your father?
M: No we're not, we'll dedicate this to my good mate Jamie, who's sitting on the bed now.
F: Right, hello Jamie. And anyone else? Any top totty in your life at the moment?
M: Unfortunately no.
F: The totty factor is quite low at the moment is it?
M: It's dead.
F: It's dead? What, nothing?
M: Nothing.
F: What, zero? Well, that's pathetic. No wonder you're down. You stay out til four o'clock and nothing. We'd better have words when we're off the radio I think. We need to give you a team talk. You have a good night tonight.
M: And you.
F: Take care.
(song starts)
F: Actually something was going through my mind. I think I'll leave it.

I'm not really sure whether this is in any way about me. It probably isn't. Probably it's just my nasty suspicious mind finding links where none exist. However, here is an explanation of why it might, possibly, be about me.

Throughout this interview, I was throwing abuse at the radio, and to my mind, Neil Fox was hearing the abuse, and responding interactively. This explains why he sounds so stressed when talking to telephone caller Martin, and the general violence of his words including "Boy you're going to get your arse kicked later aren't you".

The piece starts of with the producer shouting the name of the caller, which might be related to my loud vocalisations at the radio. The trouble starts off with Fox saying "That's sick". "Sick" might be taken as a reference to my condition. Then Fox says, "Why is he being sicko, is he being a sadist?", again sick = my illness, "sadist" = attitude of my oppressors towards me. "that's ill isn't it" = further comment on my illness. "Is he like victimising you or something" = again what my enemies are doing to me.

Fox sounds quite happy when he gets Martin to say "It's sick"; as you would expect him to, if the comment were directed at me. It is a constant feature of my enemies' harassment of me that they get intermediaries to verbalise the abuse. Immediately after saying "victimising you" Fox gives a little laugh, to show he thinks the victimisation (of me, not Martin) is funny.

Fox gets increasingly nasty as the piece progresses. "Boy you're going to get your arse kicked later aren't you" is not really what you would expect him to say if he were just talking to Martin. Fox is on the same side as Martin, so why would he be so verbally aggressive to him? On the other hand, if the piece is about me, then his strong words start to make sense.

Fox's jubilation at finding that Martin's "totty factor" is "dead" again doesn't make much sense unless you think that he might not be considering Martin's totty factor, but mine, since it's a fairly well known fact that my "totty factor" is not significantly above zero.

To round off the 135 second interchange, just as the next track is starting, Fox says, "Actually something was going through my mind. I think I'll leave it". Given that I was chucking abuse at Fox throughout, it is only natural for him have thought up a reply that he would have wished to have made, except that such a reply would (a) probably not be suitable for a family show, and (b) have given the game away completely.

So there you are. You the jury, what say you in the case of plaintiff vs. Neil Fox's Juke Box, guilty or not guilty?

Foxy's Showtime on Capital FM 25/11/98 7.35pm

Certainty level: 100%

This one, I can say with absolute certainty, is about me. It was recorded on my Sony Recording Walkman on the evening of Wednesday 25 November 1998. It doesn't mention me by name, so the objective observer might have trouble understanding why I'm so sure it's about me. I'm sure, because the harassment had restarted over the period when this piece was broadcast, and what Capital transmitted would have been in context with events at the time. (Sorry if that explanation is somewhat opaque, but I don't really want to embarrass myself by giving an explanation in detail, and an intelligent reader should be able to work it out for him/her self.)

This isn't the first time Capital have "got at" me; they were doing so right at the very beginning in summer 1990, when they said, "if he listens to Capital then he can't be all bad"; and Tarrant made remarks about me in his breakfast show in spring 1994, when he said, "you know this bloke? he says we're trying to kill him. We should be done for attempted manslaughter."

Unfortunately I didn't record those previous, much more conclusive instances of harassment by Capital DJs, and Capital Radio tells me they only keep recordings for three months. But lately I've been recording everything, and here is one product of that recording.

Neil Fox was introducing some petite Swedish songstress, sounded like Amelia, when he said something about her petite-ness ;

"she's a big big girl, actually she's really about tiny, she's this big, would you say what less than....."

then one of his studio staff shouted, "six inches"

then Fox laughed and said, "less than a meter tall, definitely"

What I think the "six inches" referred to should be obvious. I think it's sexual abuse directed at me.

Also there were a lot of words like "crazy", "mad" etc on this programme, which reinforced my belief that this was on purpose directed at myself.

I think Fox may be something of an unwilling participant in this abuse, he doesn't want to be an abuser but the persecutors are using his show and his staff to get at me. This is not the first time this sort of thing has happened from his show; and my guess is that it won't be the last

Hi fellers...

I have two nice vintage receivers that are excess to my needs. Both are in excellent physical and electrical condition with manuals. I am interested in swapping...SWAPPING ONLY...on something(s).
I am particularly interested in Collins 51J-series, Hammarlund HQ-180 series, R-388, or anything else interesting and vintage. Will consider swapping either or both. Also interested in 1940s-1960s transmitters.

What 'cha got?

Message-ID: <AICAi.12164$3x.8531@newssvr25.news.prodigy.net>
Source record: 7089

I have several like new fully tested and working Rotators for sale:
1. HamIV & Control Console from Norm's Rotor Service, never used, perfect, includes the Brake De-Lay Board installed by Norm.
This one is better than the new ones! Includes Invoice from Norm's for $504.55 dated 6-17-04. I was going to use this one myself, but I never got around to putting up my antenna. Manual included. My price is $425 shipped in CONUS.
2. HamIV & Control Console in near new condition. This is one of the later HamIVs with the plug on the Rotator Housing vs. the 8 pin Termnial Board. The Console is a Tail Twister model in a excellent factory Black Case. Includes a copy of the manual. Price is $325 shipped in CONUS.
3. Ham II with Control Console. Another near new condition rotator. This is an older model with the Beige and Black metal Console.
It is a mediam to heavy duty rotator handling up to 7.5 square feet of wind load. Comes with original manual. Very little use. Works and looks great.
Price is $250 shipped in CONUS.
4. Alliance HD-73 Heavy Duty Rotator with Control Console in Original Box with all accessories including Lower Mast Mounting Bracket, mounting bolts, original manual. I am not sure if it has been used at all. Does not look like it. Works great. Price is $225 shipped in CONUS.
5. Alliance HD-73 Heavy Duty Rotator without Control Console. Also looks and works like new. Lower Mounting Bracket and Original Manual include.
Price is $175 shipped in lower 48.
6. Alliance TENNA-ROTOR. comes with Console and Original Manual. In nice conditon and works good. This is a light duty TV antenna type rotator. Price is $85 shipped in CONUS.
I also have several Lower Mast Mounting Brackets for the HamIVs for $25 each. Thanks, Charlie Hugg, K5MBX

Charlie Hugg <k5mbx@sbcglobal.net> wrote:
>I have several like new fully tested and working Rotators for sale:

I'm looking for a cheapie Alliance control box... I have a rotator that has the two windings and sends a contact closure at end of travel, and a control box that receives a step contact closure, which is of course incompatible and not useful. If you have any junk control boxes that are compatible with my rotator, let me know.

From: novatech@eskimo.com
Message-ID: <fb9v4i$v69$1@eskinews.eskimo.com>
Source record: 7091

I picked a cheap SW-4A that had a messed up PTO. There appears to be a spring loaded plunger that forms a 'dial stop' as it drops into a hole on the brass gear. If the pin in the tuning shaft was little longer, this would stop it. Is that the way it is suppose to be?

I found several websites that show rebuilding of the PTO, one says "the worst thing you can do is turn past the stop," but haven't found one that answers this question.

TIA,

Steve.

WESTERN CONNECTICUT HAMFEST
Sponsored by: Candlewood Amateur Radio Association - CARA

Sunday, September 16, 2007
Table Set-up at 7:00 AM.
Open to the public 8:30 AM to 12:30 PM

Edmond Town Hall, 45 Main St. (Route 25), Newtown, CT Exit 10 off of I-84

Admission $5.00, Kids Under 12 FREE.
Tables $12.50 Tailgating $8.00. (Both INCLUDE 1 admission).

ARRL Sanctioned. Talk-in on 147.300 (+) PL 100.0.

Seminars
- Mechanical TV – Those were the days
- Airmail – How it works, incl demo
- Satellite Communications – How to do it
- NVIS Antennas (courtesy of ARRL)Handicapped Access. Ham Radio Equipment.
Batteries for Emergency Comms. Computers. Door Prizes.
Refreshments. Ample Parking. Rain or shine.

Only 12 minutes from Brewster, NY, 15 minutes from Waterbury, CT.

For information
call: (203) 938 4880 or (203) 775 1946

I need several manuals - NONE of them listed. Waste of time - hardly any military manuals listed - and most that are - can be found for free elsewhere on the net.

2551. Needed: Schematic for AN/URA-8A CV-89 converter.

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-09-02 19:54:44 UTC
From: Randy or Sherry Guttery <comcents@bellsouth.net>
Message-ID: <8yECi.78247$jH3.21446@bignews6.bellsouth.net>
Source record: 6999

I've found MOST of my cv-89: the main frame and the filter back pack -
but no case (which included the ID of the connectors across the back).

Sure wish I knew what I did with the case!

Anyway - the CRT was dead - got one from ebay - and now it seems to
work. Time to hook it up and see if indeed it does. Probably needs
re-capping - so a schematic would be nice on all counts.

Thanks!

2552. FREE: Oil filled capacitors

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-09-02 20:48:16 UTC
From: Smokey <nospamtelegrapher@hotmail.com>
Message-ID: <13dm8em9ju1pc8d@corp.supernews.com>
Source record: 7000

I have eleven oil-filled capacitors/condensors to give away. They have all been checked and are at their rated value or higher. They are as follows:

- Five 4 MFD 1000 VDC
- Two 0.5 MFD 2000 VDC
- One 10 MFD 600 VDC
- One 4 MFD 2500 VDC
- Two 10 MFD 200 VDC

Grey metal cans with porcelain supported terminals.

All to go as a lot. Shipping will be based on actual weight which is around 15 pounds.

Drop me a line with your ZIP code and I will pack-up, weigh and provide shipping amount. Money order or PayPal accepted.

2553. FS Nice TenTec Corsair II and 260 PS

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-09-02 20:57:27 UTC
From: Charlie Hugg <k5mbx@sbcglobal.net>
Message-ID: <QsFCi.1681$3Y1.1068@newssvr17.news.prodigy.net>
Source record: 7001

I have a TenTec Corsair II and matching TenTec Model 260 Power
Supply for sale. They are in very good cosmetic condition
with only a few minor scuffs and scratches on the cabinets and trim. The
Front Panels are very nice. The frequency readout is bright and clear and
the VFO
works good. No problems in tuning in CW or SSB. I don't know if it has been
rebuilt.
It receives very well and it puts out 90 to 100 watts output on all bands.
It comes
with the original manuals for the Corsair II and the TenTec 260 Power Supply
No mic or optional crystals are included.
Price for the station is $450 plus shipping from 79602. Digital pictures
available.
Thanks, Charlie Hugg, K5MBX

From: Jim Flanagan <jflan@ItampaHATEbaySPAM.rr.com>
Message-ID: <46dcac51$0$28811$4c368faf@roadrunner.com>
Source record: 7005

Hello,
I'm running short on options and am hoping someone will know where I may find tech data on the following oscillator. I've been looking for several weeks with no luck. At a minimum I would like to know the pin out for this device. Does anyone know how to do a Navair data search? Any help would be appreciated...

Thanks
Jim
WB5KYE

Here is what I know about the oscillator...

Austron# 1630-2R
NAVAIR# 247AS-CO393-001

This is a 10MHz oscillator with an octal base on the bottom. Unit is dated 1978.

2558. New owner of HP 410LR VTVM - need probes - where to buy?

Hi,

Just picked up a HP 410LR cheap. It came with no cables/wires besides
the AC cord. That is, no probes. I understand to make full use of this
instrument I will need some special probes. Where can I get a set? I
plan to use it to calibrate my tape machine and to fix tube amplifiers
in general.

Thanks,
Chris

HP410LR? That's a new one to me. I am aware of the 410A, 410B, and 410C, but not the LR. The 410(A,B,C) have their DC/Ohms probes wired directly to the instrument, and their AC probe has a vacuum tube diode in it, and plugs in by way of a Stereo Phone Plug.

Can you describe this instrument for us?

-Chuck

There may have been a cheap and easy way to get your VTVM working, but I see that your application will (may) require a.c. measurements. The DC, Ohms, and ground probes can be obtained on Ebay, etc. by buying a couple of sets of the military general purpose probe kits. Simply cut off the plug ends and directly connect them to your meter. Some HP 410's have the probes entering the front panel via small holes, others use a screw-on assembly on the lower front of the unit. I'm not familiar with the "LR" version. The problem is the ac probe. On the 410A,B, and C, (to include several military clones) the a.c. probe has a powered detector (diode) inside the bullet-shaped probe housing. Although any of the 410-series probes will interchangeably with the the above versions, I can't speak for the "LR". If you don't need frequency response and accuracy up to the rated 600MHz, you could use a simple detector diode and a resistive divider. You would need to re-calibrate the a.c function, of course. If, on the other hand, you're going to use a scope to measure a.c. signal voltages, you would not need the special a.c. probe.

Chuck is correct... on the "C" model, the a.c. probe uses a 1/4" stereo
plug. The A, B, and MIL models are hard-wired either directly or via a
screw-on terminal assembly.

Sorry, it's a HP 400LR, a rack mount version of the 400L.

My unit has binding posts.

The 400 series meters are AC meters, they do not have
DC or resistance ranges. The 400L is the same meter as the
400D and H other than the special meter movment which
displays the voltage on a logrithmic scale and has a linear
decibel scale uppermost. It does not need any special probes
or accessories. The meter movment is a 1% tracking meter
movement with a mirror scale to eliminate parallax similar
to that used on the 400H. BTW, the only difference between
the 400D and 400H is the meter movement and use of a mirror
scale on the meter. Meters made after -hp- introduced
taught-band meters all have the same tracking accuracy since
each meter was individually calibrated by machine. The only
difference here is the use of a mirror scale on the 400H,
the 400D will also track to 1%.
There were at least three versions of the circuit used
in 400D and H meters so you must get a handbook for the
serial number series you have. The later meters used a
circuit which is substantially different than the early
meters.

Richard is correct. May I add that my HP400H, the model with linear scales, was full of black plastic encapsulated paper capacitors (sometimes called bumblebees or black beauties). These capacitors are well known for their failure rates. There may be a reason you got a good price on your meter.

Nope, very easy. Just don't use disk ceramics. Something in a polyester,
or polypropylene would do nicely.

I am curious why you recommend against using disc
ceramics.
BB's are found in a lot of high-quality equipment. They
were supposed to be high-performance deluxe caps when they
were sold but very quickly got a well deserved bad
reputation.

Hi Charlie,

Have you tried RF Parts? Because they're inexpensive (compared to other tubes), rather than taking a chance on used tubes, I'd go with new: http://www.rfparts.com/572bprices.html. FWIW, I recently replaced my 30 year old Eimacs w/ their house brand (Chinese-made) 3-500ZGs and they're working fine in my SB-220.

Disk ceramics, particularly Z5U, or X7R, are a bad idea in any signal path. The feature that gives them high capacitance for their size also makes them highly piezoelectric: meaning they change physical dimension with applied voltage. This large change in dimension makes the capacitance non linear with voltage, and also makes the capacitor's power dissipation change with applied signal. That means distortion.

NPO's behave ok, but are of such low values that they would never be able to substitute for a capacitor such as a BB.

I have used Z5U ceramic capacitors in high signal areas and actually heard them "sing" along with the signal. Not a good thing!

Their capacitance is also extremely sensitive to temperature, which makes them useless in most timing applications. [I did use one once as a temperature transducer in a cheapy RF telemetry device...]

They work adequately in logic circuits as power supply bypass.

BB's are actually a pretty good capacitor, but they have a couple of failure mechanisms that render them useless over time. They are an oil filled paper capacitor with a black epoxy case. If you look at the banded end of the capacitor, you will notice the lead has a bulge where it leaves the case. That is actually a piece of brass tubing that was used in filling the case with oil. After the case was filled, the lead was stuck into the hole, swaged to keep it from falling out, and then soldered shut. The problem comes when the BB's banded lead is soldered into the circuit. If no heatsinking is used, the solder seal melts, and the oil spoils the seal. From that point forward, the oil will seep out of the capacitor, and moist air will seep in... it's a slow process that takes many thermal cycles,

but we are talking about old stuff here. The other failure mechanism is the plastic case shrinks over time and breaks the seal around the leads, and sometimes even splits the case into pieces.

The BB's are all bad by now, and should be replaced on sight, but when they were new, they were a nice high performance capacitor.

OK about the ceramics. I think there must have been two series of Black Beauty caps. Not all are oil filled. The ones I removed from an SP-600-JX for instance, are paper impregnated with polyester plastic. They are dry and don't have filler tubes. I suspect the main failure mode for these is due to the incapsulation. Many seem to have cracked and even those which have not cracked often have low capacitance and high dissipation factor. The capacitor winding is

usually physically distorted, flattened for instance. I
suspect that the case shrinks distoring it and also may
allow moisture to enter. These caps were supposed to be much
better than the wax coated paper caps of the time.
Sprague also made a similar capacitor, that is a dry
polyester impregnated paper cap, but in epoxy-dipped casings
called Orange Drops. AFAIK, these have proven quite reliable
and long lived, giving some support to my idea that it was
the molded cases of the BBs that failed.
BBs are found in a lot of high-quality equipment,
General Radio, Hewlett-Packard, etc, used a lot of them.

2577. Why Many Hate Porn?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-09-06 10:21:29 UTC
From: destroyingirrationality@yahoo.com
Message-ID: <1189074089.336716.36290@o80g2000hse.googlegroups.com>
Source record: 7025

Human natures are fine tuned for gene pool survival.

The way we evolve in the gene pool is that when we're not at war,
we're in a race.

Peace and freedom means competition. Some people are uncompetitive. So
they don't want to compete. Those people demand slavery.More...

Those who demand slavery are not necessarily poorer or richer,
superior or inferior. Those are people that somehow do not like
competition.

The farm owning farmers in southern US, for example, do not want to
compete with the higher salary the industrial north has, so they
demand slavery. This happens despite the fact that the landlords are
already way richer than their slaves.

Uncompetitive businesses also do not want customers to be free to
choose the best products. They demand enslavements of consumers by
restricting consumers choice to choose better products.

As time goes by and consensual productive means to aquire wealth
become available, those who oppose competition tends to be the one
inferior.

When we're not at war, we're in a race. So in a sense, some part of
life is a zero-sum game. The happiness of some superior competitors
correlate with gene pool survival of such people. This correlate with
the extinction of inferior people and this make inferior people
unhappy....page...

For example, women prefer rich smart males and normal males prefer as
many females as possible. Actually poor males prefer more money rather
than more women, but that's later.

If rich smart males get more females, then rich smart alpha males will
survive better in the gene pool. That means, the other males do not
get any. Hence, the lesser males will not be happy. They will then
come up with monogamy to ration females in equal share for everyone.

Those who are uncompetitive are not going to say honestly that they
are disgruntled competitors. They're going to come up with some
religious unscientific fairy tales to come up with pretext that
freedom, such as free sex is wrong.

In short, whenever someone is happy, whenever something gives
pleasure, happiness, and money, you can count that someone, somewhere,
somehow, will come up with some fairy tales of who knows what that

somehow it's wrong, bad, and should be prohibited.

The preference to snuff of happiness earned by others are called envy. In a sense, those who want to be happy are meant to kill each other with those who are envious.

Unless those who run the fastest also hit the hardest, success is simply a bridge to a gas chamber. Deviation from free fair competition turns life into some form of gun fight.

Not everyone can be appeased in a gun fight. Envy is simply unappeasable. The way to keep pursuing our happiness and still be alive is either to kill, or threaten to kill, those who are envious of us that it's not to their best interests to kill or prosecute us....page...

That's why I strongly support death penalty. Without it, all succesful people will be slaughtered by bigots that don't mind going to jail for it.

It's also the same reason why many ugly women oppose porn. That's because those women are envy bigots.

Think of it this way. Pretty women can just show some skin and make millions of dollars. Ugly women has to sexually serve poor males and get knocked up for much less money.

If this keeps going, pretty women can pick the best males with the best genes and provide their sons with better education, opportunity, and more initial start up capital.

The pretty genes will survive better in the gene pool and the ugly will be outcompeted, like in Europe or Japan. All thanks to porn.

Obviously, pretty porn stars are way better of then ugly wife. Becoming a porn star or prostitute is then one of the best job ever in this world.

However, out of envy, ugly women will want to prevent that. What's their justification? By saying that all the good jobs are so bad that it can't possibly consensual, and hence has to be prohibited.

They said that porn should be prohibited to protect women. Which women? Not the consenting one of course. How in the earth people get protected from consensual offers anyway. It's there to protect disgruntled envy competitors.

There are Black Beauties, and there are Black Beauties!

The oil filled Black Beauties, in my experience, always have
color coded bands that tell the ratings. They were a premium
capacitor, and as such were quite expensive.

The polyester dielectric capacitors have black bodies, with
red lettering. I recall that they came out after the oil
filled capacitors.

Orange drops were a step up from the waxed paper capacitors,
and a step down from the molded polyester black beauties.
They were designed especially for printed circuit board use.
Orange drops were a relatively cheap "jobber" capacitor, but
they have certainly withstood the test of time quite well.

-Chuck

All the BBs I've seen had colored stripes indicating
the capacitance value and other data. These were dry caps.
Not dried out oil-filled, there was no trace of oil or means
of adding it.
According to Sprague advertising of the time (early
1960s) the BB and Orange Drop had identical construction
other than the encapsulation and radial leads on the ODs. I
don't have catalogue info giving prices. The ODs were

evidently made for printed circuit installation as you say
and were probably smaller due to the dipped rather than
molded case. I am not sure what the case of the BBs is made
of, it appears to be a resin plastic such as Bakelite which
was widely used at the time. Bakelite can shrink and depends
very much on the filler used for longevity. They may have
been made of something else. In any case, its of academic
interest now. I remember having been warned not to use BBs
as early as highschool, meaning the late 1950's. Also, the
Hammarlund receivers began to be rebuilt with disc ceramics
about the late 1950's so the trouble must have shown up
within a few years. Sprague continued building the cap so,
perhaps, the cause of the problem was discovered. They
should have been a superior capacitor. Too bad.

Well, you look at the copper strap connecting the 6 meter tank to the tubes.
Those.are called "strip lines" and are what resonates the tank on 2 meters.

Now to replace those 4CX250s with 3CX800s or a pair of 4CX*** in that
range <:-)). I'm using a single 3CX800 on 2-meters. It's just the
thing for WAR (Worked all Repeaters) <:-)) and no in case anyone took
me serious, it's for SSB and CW although I keep telling the locals
it's for packet.

Richard, All BB's with color bands made in the late 40's,
through the '50s were oil filled. The filler was not all
that obvious unless you knew what you were looking at. It
looks like a little solder ball on the banded lead where
it enters the case. The cases look like bakelite, but I am
not sure that they are. Bakelite requires high temperature
and high pressure to cure (hence the "bake"). I don't think
that would be good for a plastic dielectric capacitor.

By the early '60s Sprague had thoroughly taken a drubbing over
the failures of the BB's, and changed them to be a plastic
dielectric, like the OD's.

I don't think I have ever found a bad OD; nor have I ever found
a bad BB that wasn't of the oil filled variety.

Nah! Those are simply hi-Q, low inductance, inductors that happen to be made
of copper strapping.

Strip line is a transmission line that is made by putting a strip of metal between
two ground planes. It's impedance is determined by the width of the strip, the
spacing between the ground planes, and the dielectric constant of the material
between the ground planes.

Strip line used to be used quite a bit on microwave circuits that were built
on printed circuit boards. It was replaced by the simpler to make micro-strip
line, which is a strip of metal(copper) on one side of a board that has a ground
plane on the other.

Well, I don't know. The BB's I've gotten from Hammarlund
receivers and some other equipment date from the mid 1950's
and are definitely not oil-filled nor do they have the
filler tubes. I've taken them apart: the dielectric is paper
impregnated with plastic. It looks a little like the very
fine paper used in Chinese cooking, thin and translucent.
These all have stripes on them and no printing. Some of
these have a thick end from the way the end leads are
fastened to the foil. I really think there must have been
two versions of the BB series. Perhaps the plastic type was
a replacement for the oil-filled kind. They would have been
easier to make and free from leakage.

All the BBs I've check on a capacitance bridge, even those which appear new, have somewhat low capacitance and somewhat high dissipation factor. Of course, both could be accounted for if they were actually oil filled and the oil is gone to the extent of leaving no trace whatever. It would be interesting to know what the molded cases were actually made of. The material does not quite look like Bakelite but there were many variations of resins sold as Bakelite and under other names like Durez. Old catalogue date could answer some of these questions.

Hi Richard,

My experience with BB's is primarily with Tektronix and HP
equipment from the very late 1940's to the early 1960's.
They both used the banded BB's, and they were all oil filled.

After the oil filled BB's failed in droves, Sprague changed
the BB's to a plastic dielectric, which is, I believe, what
you have seen. There might have also been a difference depending
on the WV rating of the capacitor. The oil caps were 600V rated
as I recall.

I have never seen an oil filled BB, that had failed, that wasn't
all fuzzy and goopy on the outside. The mineral oil definitely
didn't just evaporate.

It seems to me I've also seen some BB's with oil on the
surface and maybe dripping. At some point I will have to see
what I can find in the library to try to date the change in
design.

Source record: 7039

Hello All,

Just got a BC-610E, with an RF section with many issues. I would like to make my job easier (already LOTS to work on just to light it up) by just replacing the RF section whole, and work on the old RF section (or part it out) after the main restoration.

I know that it is not very likely, but here it goes - is there anybody who has a junker that can spare the RF section, including the following:

Right Side Sheet Metal
Front Middle Sheet Metal
Intact coil socket
Fairly clean and intact TU plugin section

Or perhaps somebody has a junker to spare these parts?

Will also consider units with most, but not all of the above. Perhaps we could swap RF sections with compensation? Not looking to buy an entire -610E.

Thanks all,

David Goncalves

2600. HQ100 alignment

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-09-12 04:37:17 UTC
From: Nelson Gietz <ngietz@mts.net>
Message-ID: <J2KFi.272185$BX3.148506@newsfe13.lga>
Source record: 6948

Hi all,
Has anyone got detailed and correct info on
aligning a Hammarlund HQ100? The admittedly
poor copy I have seems to advise tuning the RF
input transformer T1 at 6 mHz, which is impossible...
it's the BC band.
Maybe a decimal disappeared on this print?
Hopefully,
Nelson

Hi,

Possibly 0.6 MHz, or 600KHz.

Tuneup for most any RX is the same.... twiddle the coil at the low end of
the scale, cap for the high. At least so I was taught.

Cheers,

--
Gregg

you can download the manual from BAMA. 6 mHz is correct for one part of the alignment. It doesn't matter what the band is used for.

http://bama.edebris.com/manuals/

Thanks to Shire we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday September 16th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Thanks geek, Deek, and Don;
I'm using the BAMA manual. Still think a decimal
is not showing up on at least part of this copy. Will
try to psych it out.
Cheers,
Nelson

Nelson, I'm looking at an original HQ-100 book. There us no reference in the book for an adjustment at 6 MHz. As I read the alignment pictorial (Figure 7), the left rear-most can (T-1 antenna) is adjusted at .6 MHz. The right, front-most can (L-3 oscillator)is adjusted as follows: top slug is adjusted at .6 MHz, the bottom slug at 1.65 MHz. Does this help?

Try:
1. Antique Electronics Supply in Phoenix, AZ
2. Triode Electronics in Chicago
3. ESRC in Florida

I can't even find a datasheet on the thing... but it looks like a
pentode designed for a battery-powered radio.... 1.5V filament, 90V plate.

I am thinking a 1LD5 or 1LC5 might be a reasonable sub, with a base
adaptor.

Maybe, but I found a bunch of circuits using it out there, like this one:
http://frank.pocnet.net/short/001/1/1SA6.gif which shows an IF stage.

This gives you basing and pinout, some nominal operating voltages, and you
can make a rough guess about transconductance.

It's a octal base, pentode RF amp. The suggested replacement is a 1N5GT.

Any idea who made it? My RCA data books cover the era when it must have been
made, but have no listing.

It's not in my 1955 GE book. Not in a slightly newer Sylvania one either.

I got the tube info from my old Sylvania tube manual. It was up-to-date
through mid-55. The tube was listed in the condensed section, so it was
obsolete at the time it was printed. Don't know who all made it.

The 1N5GT was fully documented, so it was somewhat modern at the time.

My RCA books have the 1N5GT well documented, as you say, but nothing on the
1SA6. They must not have thought it worth stealing. What do you suppose is
the 6th element in the 1SA6?

There's no "sixth" element - it is a pentode. I have no idea why it's a
"6"...

See here:

There is condensed data in old editions of the _ARRL
Radio Amateur's Handbook_, I found it in the 1947 edition.

Often, the extra element is a shield. So I suppose that could be the
answer.

A local estate has one to dispose of. I suspect this was a companion amplifier to the old HW-12-22-32 series monobonand Single Sidebanders.

Has anyone ever seen one of these? We can't find any mention of them in Heath literature we've looked at.

Is it common or a rare oddidity?

Is there any colector value?

I don't remember seeing anything like that. Heath did make a very
low slung power amplifier, close to the power limit, that had
potential as a mobile amplifier (I can't remember if it was really
intended for such use, but the low size made it more usable there,
and the other Don Miller (of SSTV fame) used one for a while mobile).

But that amplifier covered all the bands (except 160) available at
the time, which was the sixties.

If you don't have an actual Heath number, and haven't actually seen
it, isn't it more likely that the description is garbled?
a multiband amplifier
a non-Heath amplifier
not even an amplifier

The Heath HA-14, and I believer there was a mobile power supply
available for it.
I built one in college for my home station even though it was
primarily sold as a mobile amp. It is essentially
the RF deck from the SB-200 and runs pair of 572Bs. The loading
control was "fixed"; which meant the antenna had to be near 50 ohms.
I ran that little amp pretty hard, even on RTTY once or twice, and it always
held up. And it was only a hundred bucks or so back then! I wish I still
had it.

Pete is right, the HA-14 was a 2 tube mobile ampflier, but it was not single band (as I remember). There was a mobile HV power supply as well that match this unit.

2643. Your opinion on this Heath Marauder...

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-09-16 00:49:01 UTC
From: "Rick (W-A-one-R-K-T)" <get.my.email@from.qrz.com>
Message-ID: <pan.2007.09.16.00.48.56.306930@from.qrz.com>
Source record: 6991

After looking all year, I finally got my Hammarlund HQ-180A, have it set up and working here in the shack, and it sure works nice for a 50 year old boat anchor.

Now I'm looking for a transmitter to put with it. I'd really like a Heath DX-100B because that was my first transmitter back in 1962, but I'd kind of like SSB capability so I'm looking at a Marauder.

See http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=180159772887&ssPageName=STRK:MEWA:IT&ih=008

This one has come up for auction with a "buy it now" price of $195 (and a shipping charge from SC to NH of around $75 <grumble>).

The cabinet does look a little rough, and the chassis could stand some cleaning, but the front panel looks OK and if it works as well as the owner says it does, maybe $270 (including shipping) isn't too bad.

What do you all think?

It's a bit of a puzzle. Pin 1 is marked "S" meaning "metal shell, but that
wouldn't apply to the GT version. Also it wouldn't be considered an
element. If the tube had an internal shield it would be designated IS. No
other elements are shown.

Rick, We all try and see what we want to see with this stuff.... After
I went through two Valiant disasters shipped in, I waited until a
confirmed good one became available, locally. I'd personally pass on
this one, even though it purportedly puts out power. It looks a bit to
rough for the bottom line you'll have to pay. The shipping always seems
to tip the scales. Just my opinion.... de K3HVG

The Mohawk and Apache had some complex mechanical arrangements. I have never examined the Marauder, but since it was a later model, I assume things were better.

I agree with Jeep (K3HVG). If you want one, get a good one that you can personally inspect. You might put an ad in Electric Radio and be willing to drive a few hundred miles to get just the right one.

Wives and radios are alike - always easier to start with a good one.

It certainly does look a bit rough. But I suspect there are not that
many Maurauders out there. Certainly there are many more DX-100s around.
How long have you been looking for a Maurauder? How often do they turn
up for sale in any condition?

I used to collect rare records, and I learned the hard way that when you
find something rare that you really want you should just buy it, because
the next time you see it the price will be even higher. Condition is
always a factor, but you can do a lot more to fix up a beat up piece of
electronics than you can do with a record that has been abused!

The price is less than what the kit sold for 45 years ago. Considering
what other equipment of this era is now selling for, it seems pretty
reasonable to me even in this condition. If it's working as well as the
seller describes it may need nothing more than cosmetic attention.

Just my $0.02 worth. YMMV. Good luck!

I owned a Heath Marauder many years ago. They are known
for weak power transformers...

One other problem is that Heath put the SSB filter
on the input side of the IF amplifier... The transmitter
has a bit of broadband white noise either side of the
carrier. If you ever run one with a VHF transverter
the locals WILL let you know about it :)

I think this point is valid. I wasn't around the hobby at the time, but
from reading the magazines, it was sold for a relatively short period.
They then switched to the SB line (or maybe there was something in
between) which was far more compact.

Heath tended to do that, keep the same basic equipment but change
the cosmetic look (with some internal changes) over the years. That
the SB line lasted so long is somewhat a surprise, but even then, it
there were at least three "editions" within the line before the dramatic
change of the digital one, was it the SB-104?

2651. How to get started restoring a DX-40

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-09-17 01:46:09 UTC
From: "Rick (W-A-one-R-K-T)" <get.my.email@from.qrz.com>
Message-ID: <pan.2007.09.17.01.46.07.584084@from.qrz.com>
Source record: 6901

A neighbor gave me a Heath DX-40 transmitter and VF-1 VFO that had been sitting God knows where for God knows how long, and tonight I pulled them up into the shack from the garage to see what if anything I could do with them.

You can see the "Before" photos at http://www.rkt-tech.com/DX40 (at least for the transmitter ... I haven't taken the VFO out of its case yet).

You can see that it needs a little work. :-\

(Amazingly, though, the underside doesn't look half bad...)

Having never done one of these restorations before ... where do I start?

I know ... "First, get a medium-size trash can and lay them both gently within...". I also know about what they'd be worth if they were in good shape... not nearly enough to justify the work. Still, I would like to see if I can get them running just to see if I can.

What kinds of cleaners can I use to clean the cabinet (as best it can be cleaned) and the top of the chassis, that won't eat the paint from the cabinet or damage the components inside (assuming any of the components are any good)?

Then I guess I'll need to find me a variac... pretty sure there's one around here someplace...

You're kidding about the garbage can, right??? If not, I'll take them off
your hands!

I'd definately replace the DX 40 filters to start with. 40 or 50 year
electrolytics
are garbage, even you can reform them... Spend a few bucks and do that
part right. Any other electrolytics or paper caps should also be changed.

Check the resistors for obviously signs of overheating. You could do a quick
ohmmeter check to see if any have shifted upwards in value while you're at
it.
The little VF-1 probably could stand a quick alignment, not much to go wrong
with her! You might check the tubes, but if the transmitter makes power then
you are good to go. Clean the cabinets with soap and water or some Fantistic
spray cleaner. You have the start to a real nice classic station; enjoy it
and
treasure it.

Remove the tubes and scrub the chassis with
an old toothbrush and some cleaner after blowing
away the loose debris...

Be careful not to get any liquids into wafer sockets.

The cabinets might need to be repainted, they look pretty gross.
If the front panels are good it would be worth the effort.

Too bad you weren't able to rescue those a few decades
earlier! I would do what I could to restore them if
they were mine!

I'll certainly second what's been said. The goop on the cabinets may well be removable with some of the current cleaners (to include Goof-Off, used with care!). You might even consider un-building the unit and clean the chassis up completely. The front panels don't look bad, at all, and you'll end up with a nice set of equipment. One can't judge the effort based on the dollar value of your time.. you'll lose that trade-off in a heart-beat! Its the fact that you did the job and the results that count... Give it a try. Any bad parts you might find, except maybe the power transformer, are readily available. Those two units are an ideal entry point for the restoration process..... de K3HVG

Cleaning and refinishing the case will be the toughest job. If the stain is corrosion then a replacement case may be an option [watch eBay]. If it is stained, a fine grit sanding followed by little spray paint [AKA Rustoleum Gray] will provide a decent finish.

Electronically, change out three electrolytic capacitors in the DX40 before you even think about applying power. The two orange/tan electrolytics shown in your photos [basic power supply] and the blue one at the lower side [300 VDC for oscillator, etc.]. I used LTE electrolytics. The LTEs have different physical configuration but were useable and inexpensive.

Get some contact cleaner and a small moderately stiff brush [solder/resin removal brush 5 for $1 variety] and liberally spray all the switch contacts and brush the wipers down to remove any 'dark' stuff. The T/R contact may be pitted. It breaks the HV power and sees a small spark when operated. Mine is pitted and still works fine.

Test the tubes, or have them tested. I picked up a complete spare set at a seasonal ham flea market for $20.

Vacuum the interior and a little burnishing should clean up the chassis.

Mine took about 3 hours to clean up and get operating. It cost about $35 for electrolytics and spare tubes. I've used it on 80/40 CW and 75 AM phone. [It is a little pistol on AM phone though].

It is a nice rainy day project when there are no sports on tv, XYL is out shopping with your daughter, and the lawn mower needs repair.

NOTE: Fix the lawn mower after the restoration :-)

> Does this help?

Yes, very much... that's exactly what I was hoping for. The BAMA Djvu
and .pdf files are okay, but one does not show a decimal, and the other
shows only a vestige... not much more than a pixel. If you blow it up
enough
on a graphics program, it's visible. That's a hazard with using scans, I
guess.
Along with some other things, it seems the primary on T1 got cooked at
some time, and the rewind job was simply hand-spinning some enameled
solid on there. It's in very good hands now, getting what I expect will be
an excellent rewind... although we're still working out turn count and wire
gauge for it.

The metal cabinets are not that bad. Any half decent paint booth at a good
autobody shop can remove the rust prime and paint in yoru favoriate gray to
match.

PATIENCE is the kep skill for restoration work. IF you don't have that --
pass these on to someone who has it.

I always liked the restoration project described in QST some years back
(I gues more than "some" at this point). He basically stripped the
transmitter down, I think it had started out as a kit, fixed up
the chassis (and had it commercially plated) and then started building.
I seem to recall he used quite a few new parts, like all the resistors
and capacitors, perhaps event the tube sockets.

He probably did end up with a more reliable rig, though I'm not
sure how it gets classifed.

The underside of this rig looked pretty damned clean to me - unless I missed anything. The top looked (to me) like a good vacuuming was in order - maybe some cleanser. The case - looked the worse for wear. But - as others said - nothing not able to be done. NICE project!

OK, I reUPLOADED the Hammarlund catalog. Try this link. Hope it works
now. Thanks for letting me know. If it still doesnt work I will try
something else. 73, Randy

OK, its still not working. I have asked for help from MediaFire and I
will see what they say maybe the problem. It had been working well up
till recently. I will try again after I find out what is going on.

Thanks, Randy

There are scant few choices if you are looking for a AM TX with high
level plate modulation as well as SSB.

You could go with a Johnson Ranger or DX 100 + a SSB converter.

A good inexpensive SSB TX is the Drake TX series. It does AM using
controlled carrier. I have the T4XB & it is excellent. The Collins S
line (pricey) & the heath SB units (variable build quality) are less
desirable alternatives.

A very rugged yet inexpensive plate modulated AM TX is the Johnson
Viking II.

Another super cheap alternative (if you could find a good working
unit) is the Central Electronics 20A. It works all modes including FM
as I recall. You'll need an amplifier as it doesn't produce much
output.

Thanks for the offer... I'll keep it in mind. After I sent the one
off for rewind I was thinking maybe I should have looked inside the
other three first. Continuity was good on all of them... but this one
had been "rewound".
Cheers,
Nelson

Well, I see we have another panix subscriber in the group. Yeah, I liked
those old tube radios as welll. I am blind, and had a hard time tuning
them up at times though.

How did you do that? When I go to those sites, there are no
hyperlinks to download from. Just a title with no hyperlink.

Dick

Randy
The Hammarlund file downloaded ok but I get the following on the Johnson file.
The same thing happens with Mozilla Firefox.
Thanks
Dave Foreman

Internet Explorer cannot display the webpage

Most likely causes:
You are not connected to the Internet.
The website is encountering problems.
There might be a typing error in the address.

What you can try:
Diagnose Connection Problems

Not sure why it works for some and not for others. I have not gotten any answer back from MadiaFire so I do not know what the problem is. I would suggest trying everyonce in a while and see if it will find the target. I may try and setup my own web page where I can host the files myself. These free file hosting sites is a lot of unknowns. I guess you get what you pay for, HIHI.

Try using the original http://www.mediafire.com/?axzcut2zdr9 link
for the Johnson catalog.

FWIW I can open both pages with both IE and Firfox. It may
be that the site is being blocked by a firewall or a privacy
setting although that should cause problems for both URLs.

I don't have any problem opening the pages. My problem is downloading
the Johnson catalog. Hammarlund downloaded just fine. When I try for
the Johnson catalog, my computer just sits there without any download
activity. Maybe the server is just too busy.

Thanks
Using the original woked this afternoon and the download worked fine.

2690. Restoring an old transmitter

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-09-22 04:13:11 UTC
From: "Rick (W-A-one-R-K-T)" <get.my.email@from.qrz.com>
Message-ID: <pan.2007.09.22.04.13.09.412609@from.qrz.com>
Source record: 6940

I have a line on an old Hammarlund HX-50 transmitter in unknown condition (been sitting on the shelf for years).

It would be a nice match to my HQ-180A.

General consensus with old radios like that, particularly transmitters, is that the first thing one should do is replace the old electrolytic and paper capacitors.

My question is, what's the worst that's likely to happen if one doesn't do that? Bring it up on a variac, a capacitor blows, makes magic smoke happen, XYL gets really upset :-), and the fuse blows.

Some have said you can blow the power transformer but wouldn't the fuse blow first (unless the power transformer was ready to go anyway)?

General question... which is the best website for information on restoring old radios? (I know I can google on "restoring old radios" but I'm looking for opinions on the best from among the few hundred thousand hits that are likely to come up.)

Thanks...

justmanuals.com is a well known spammer on news:sci.electronics.repair
he is known for this spam tactic of post a link whether he has anything
you need, or not. Just save yourself time and kill file him now. He
will try it, again and again.

Rick, Looks like you've already stated the standard routine of
restoration, or at least the commencement, thereof. The HX-50 is not
super old so you may not have too much in the way of out-of-tolerance
resistors, for example. It doesn't take a lot to check an electrolytic
before actually bringing it up, assuming you've accumulated a
(e.g.:)Heath cap checker. Normally, bringing something up on the Variac
does give a bit of safety for the equipment, but not guaranteed. You
can still be in some degree of overload and damage may still occur. You
might consider putting a smaller than called for fuse in the rig and
bring it up, initially, that way. With no appreciable p.s. load, and
the additional protection, you may be able to safely test and/or reform
the electrolytics. Just a thought........

Sounds like a good idea, Thanks. How are you doing, Mike? Haven't heard
from you in a while. Randy finally gave up on r.a.r+p, so we don't keep
up on folks like we used to. Hope everything is going well.

Take care!

Does anyone have a suitable power cord for a Heathkit SB-301 receiver? I have a restoration that is complete other than a power cord.
Please contact me a service@transistor-repairs.com if you have one available.

Tnx Jim WA4BRX

Replacing paper caps, electrolytics, and out of spec' or stressed resistors
is part of doing a restoration.

>

It sounds like you want to hear you should take the easy way out.

> Some have said you can blow the power transformer but wouldn't the fuse
> blow first (unless the power transformer was ready to go anyway)?

Are you a gambler? You're bias supply could fail and take out the final
tubes;
the transformer could fail; cleaning the mess after the electrolytics
explode is always fun.

And, you can't reform the caps using a variac... There's no cathode emission
from the rectifiers until the AC supply is above a certain voltage.

Depends on the radio.

In the case of receivers, interstage coupling caps that are paper can fail into a short, and take out an IF can. You can't get replacement IF cans easily these days. So this is a catastrophic failure.

Transmitters are less apt to have delicate things like this to fail, but they also have less delicate things that are more dramatic when they do fail.

>Some have said you can blow the power transformer but wouldn't the fuse
>blow first (unless the power transformer was ready to go anyway)?

Sadly, not. Especially if you run the rig for a long time with the transformer overheating but the total current below the fuse current. Remember, the fuse is sized to allow a large starting current in most cases.

Using an inrush current limiter allows you to use a smaller fuse, which protects you from such things. I recommend this in newer designs but of course it's not in place in most boatanchors unless you retrofit it.

Also realize that when can caps fail, the resulting shrapnel can sometimes damage plenty of other stuff.

Excellent advice; and the ICL get's rid of the transformer "THUMP"
when the rig is switched on at the crest of a cycle.
It also does a lot to enhance the remaining
power switch contact point life.

Good afternoon, Uncle Peter.

I have been on the Internet since before most people knew the Internet existed, and I have always wondered what it is about Usenet (and Fidonet and RIME and all those BBS networks that came before the Internet) that makes people feel compelled to put other people down for no good reason.

If we were sitting around the shack here, talking about this stuff over pizza and some cans of beer, would you talk to me like that? Maybe so ... but really I suspect not, you don't strike me as that type.

I would think by now that regulars on this NG would know that I'm new to this stuff and am just looking to learn.

There's "taking the easy way out" and there's "not fixing what ain't broke".

I'm currently working on a DX-40 restoration and I have been advised to strip out all of the components and wiring and rebuild it from scratch with all new components (where available).

Seems like a bit of overkill to me.

Saving the bias supply, and protecting other components from shrapnel when a capacitor blows, all seem like good reasons to replace the caps. So, I learned something today, just like I do just about every time I post something here (thanks).

(On the other hand, bias supplies fail for reasons other than blown caps...)

I'll try Phil Nelson's site ... thanks...

What can I say. You asked for advice, and still doubt the veracity of the
advice. "Fixing what ain't broke" pretty much conveys the original
supposition of taking the easy way out.

A proper restoration involves changing parts that WILL fail, and that
includes electrolytics and paper capacitors. If you just want to get
it running, then you take your chances.

If you've been around that long, then certainly know what to
do without asking for blessings. And yes, this is usenet.

Seems like I was one of the first that responded on thread as well. I don't
remember advising you to strip all of the components and to rebuild it
from scratch.. But, on the other hand, if someone was doing a full
restoration that certainly wouldn't be unheard of. Most of the advice
you received was pretty much on the mark. Again, if you ask
for advice on usenet, I suggest you either develop a thicker skin or
keep a more open mind.

Hi Rick,

Communication is a two way street. What appears harsh to a reader might have seemed harmless to the sender. I have been told that I write mean. That surprises me, because I am a nice and gentle person. I suspect that what bothers some people is I work hard to make sure that my posts are as grammatically and factually correct as I can. That means that I have lots of details in my posts, and lots of things that might appear as being condescending.

When you read some one's post or reply, imagine that they aren't trying to put you down. 99% of the time you will be correct. Imagine that writing might be a bit challenging. That will also get you another 99%, if school scores are any indication. Keep your skin thick. That way when someone does try and make you feel bad, you will be as immune as possible to their bullying.

Uncle Peter is a good guy. I don't think he meant to be rough with you.

-Chuck

Good evening, Chuck.

Yeah, I know... he seems that way most of the time, which is why I kind of wondered why he felt the need to say what he said. Believe me my skin is plenty thick :-) ... usually I just ignore things like that, knowing that's the way things are around here. Every once in a while, though, something hits me just so and I have to ask myself why in the world so many people seem to find the need to say on Usenet what they would never say to someone's face.

It's nothing new. I'm an old Fidonet sysop from the 1980's and people did the same things back then. Never quite understood it then and don't really fully understand it now, but yes, it's the way things are, and just about all the time I just suck it up and move on.

As Pete said in another message, "yes, this is usenet"... as though that explained everything. Maybe it does.

No big deal. :-)

Thanks...

2708. Need a few parts for HQ-180A

I could use a couple of parts for my HQ-180A ... the antenna trimmer capacitor, and the S-meter sensitivity pot (the 1.5K screwdriver-adjust pot that mounts to the back panel).

I could (and will, if I have to) use modern parts but I'd kind of like to keep the radio as original as I can.

I googled on "HQ-180 parts" and several variations thereof and sent some email to several of the hits I got from there, and none had the right parts.

So, if any of you has a parts chassis for the 180A and would like to sell me those parts, look me up on QRZ and drop me an email... thanks...

Check the resistance of your test leads. They may be more resistive
than the meter has zeroing range.

Also check the battery terminals, sometimes if a battery is allowed to
leak it will wreck the low resistance contact that is necessary for the
Rx1 range to work. The battery is sourcing pretty high current in
this range.

Put a really good short right across the banana sockets and see what
happens.

Thanks. I finally got a manual for the Simpson 262 I bought used
about 45 years ago.

It could be a bad contact on the battery holder or the range switch. R X 1 uses a lot more
battery
current than R X 100 so that small internal resistances matter. The usual case is that
someone
attempted to measure voltage on the R X 1 setting. There are probably burned resistors in
the
ohmeter circuit. There is no internal adjustment for R X 1, AFAIK.

Hello All,

New season, new project. I have a rusty, gritty BC-610 in the shop.
Somebody has really cranked down the setscrews on the 'bandswitch
type' knobs - the same ones used on the SX-28 for bandswitching. They
are circle-and bar, with an 'h' in the middle.

Anybdoy have a couple such knobs that they would part with?

Again, thanks for the help, USENET - many old rigs of mine have been
completed due to this newsgroup.

Source record: 6873

Get out of the Ghetto

I am finding that when the 80 meter window is stuffed beyond capacity
and no one seems to want to move down the band that the 40 meter window
is silent as a tomb.

I have been told that itï¿½s the sunspots and propagation but just wait a
few years.

I say nonsense. There are plenty of sunspots and propagation for the
7290 Net to fill up most of the day so we know at least there is
propagation to that area and the few contacts I have made range from
East to West Coast at night.

I would like to propose a couple of schedules to get folks to use 40
meters as an alternative to 80. This is not a net, just a particular
time to get a QSO going.

The following fits my evening schedule:

07:00 CST ï¿½. 01:00 GMT
09:10 CSTï¿½. .03:10 GMT

I was told that the Noon Time Forum on 3875 could not work and it has
worked just fine for almost a year now. We have had over 100 checkins
and from 5 to 10 every day since startup.

A net wonï¿½t work on 40 because of propagation but we can at least use it
for what it is worth which is to open up to a whole bunch of AMers who
can not be reached on 80 meters.

I will be there at the above times listening and calling CQ for as long
as it takes to get something going or to get bored.

Letï¿½s start a new ghetto.

No, it's either a (very) bad connection - or quite possibly a cooked R16
- check it - it takes a beating in 260s (should be 11.2 ohms)...

regards,

I have a Drake TR-3/RV3/AC-3 combo that did well for me in the 1970's.
It was designed for a matched trio of 12JB6 sweep tubes as the final
amplifier.
Obviously, these bottles are hard to find, and a matched trio even
harder. It's to a point where the current finals can't be neutralized.

Has anyone rebuilt the final amp section with currently available tubes,
such as a pair of 6146's? I'm open to try something like that, since
the rig is still in fair shape, had good audio "punch," and could
probably have its selectivity improved by an audio DSP program.

I'd appreciate the benefit of your knowledge and experience.

Source record: 6883

It should not be difficult to convert the finals to the 6146 tubes. There is an article in Hints and Kinks, I recall, on converting another rig using sweep tubes to 6146s and it would be helpful.

The conversion should be quite straightforward and I would be willing to bet that it has been done before and information should be on the internet.

In fact, you could probably use one of the 12 volt type 6146 tubes, which are even cheaper than the 6146 types.

There are three or so popular variants of these with different diameters
and pin spacing, but Ace Hardware carries most of them.

The Belden one with the rounded corners is no longer available (not even
from Volex) but one of the Ace ones will fit with a little surgery.

You might check with Antique Electronics Supply and RF Parts -- both of them at one time would match sets of 6JB6s for a fee ($5.00 per tube?). Also Bruckner Components (http://www.powertubes.com/5Rcvg.htm) may be able to match a set for you.

There was a guy who did this for the T-4X transmitter. The link below
describes it but I can't get it to load at the moment so I'm not sure the
article is still there..

http://www.qsl.net/k5dkz/t4x6146.html

And, of course, there's the Drake list at:

OM, I might recommend that you perhaps try and use some 17JB6's in your rig. The idea was suggested to me a number of years ago and was implemented on a rig in Brazil, owing to obvious logistics problems of locating the original tube type. They did work, albeit the power was down somewhat, as I recall. I've seen the 17-volt tubes for anywhere from $3-$4 each to around $10, each. I bought some as back-up for my T4XB, in the event 6JB6's become extinct. Just a thought.....

Seems to me that there aren't any breeding pairs of 6JB6's around anymore,
so they are already extinct ;-)

I have an old SBE Model SB-35 HF Transceiver. It's in good condition, and I'm trying to determine what the value of this vintage Boat Anchor might be. It's been setting around, so not sure if I want to plug it in for fear of escaping electrons from vintage oil filled capacitors. I understand that not many of these were sold in the USA, which makes me wonder about how they would compare against say the SB-34 or SB-36 ??

If you have any thoughts, please drop me a line

Rick,

If you don't change the electroytics they might short, explode (kinda like a firecracker) and damage the power transformer. They're hard to get and expensive. A radio this old will need hem done sooner or later so why risk it. Antique Radio Supply has some new ones or you can series/parrellel new ones to boost the voltage ratings. Also change any paper caps---mandatory they leak and cause hard to troubleshoot problems. remember they usually block hv dc and pass ac soon when they do that half way watch out. This is kind of a rare transmitter so spend a few bucks and treat it right you might get your money back in a reaale or just plain enjoymnent.

73 Tony

The Dhourties' Fortresses For Killing 'Dualdigers' Off

Recently, on August 5, 2007, at 19:50, I was arrested for 'lewd conduct' bkg. code 5131, (later struck through, and changed to), bkg. code D169, Charge ORD/NRS# 12.32.020 (CCO) 0200- with the 0200- appended, Sector Beat S1, that's the best I can make of the copy I have, a photo copy of one of the original copies. CCDC OR 369/365/A, with '369' struck through. I.D.#087884, struck through, and changed to, 2647396. Event#070805-2517. In the side column of the Temporary Custody Order, it has in hand print, '1-N RT(1) nonit'. Time Stamp at BOOKING 07 AUG -5 23 27. DSD RECORD SECTION.

When I left, I was given a sheet of paper, a 'sign off by offender' sheet, with this information on it:

08/06/2007 02:36 I4732H, OIRPTRAN 6.04.4.1, Name: Ayres, John ID#0002647395, Admit Date: 08/05/2007

Date: 08/06-2007 Officer: 1544 14732H

This was for regaining my property from the inmates properties room.

I was arrested at Tropicana and Decature, on Decature, next to the area where I have my 'Gurkian Way Ministry' sign up on a large, 7 feet by 3.5 feet, 3/4 inch piece of plywood, and where I have another sign, that clearly states on the same size piece of plywood, 'GOD's Place, John Francis Ayres, And Children', where I was doing my 'Tai Chi' aerobic excercise karma erasal religious ceremony, with no clothes on.

I explained to the arresting officers, that I am duty bound by my religion, to do my religious karma erasal religious ceremonies, as well as all my religious ceremonies, naked. I explained that I am GOD, and that I am starting my own, or rather, my newest religion.

The arresting officers had many complaints from the 'assasins' group of 'hired killers', and torturers, who live in the underground, below and surrounding, the Home Depot, next to the New Orleans Hotel and Casino. Their underground complex is in part, under the New Orleans Hotel and Casino, as well.

They apparently, call the police, every time I come to my 'Gurkian Way Ministry's' office site, where I do my Tai Chi aerobic excercise, religious prayer activities.

I had been visited twice, once as noted, previously, and once by a second team of police officers, who told me to just stay in the area, where I had been sitting, and doing my Tai Chi aerobic excercise religious prayer activities, and the officers told me to not wander out naked, into the area surrounding my area, as, it was explained, that passer's by will get "offended" by my nakedity or 'nudeness' in public.

I try to figure, how can some one get offended by looking at a naked man? It's a mystery to me. Anyway, it does seem to be the case, that people can feel uncomfortable, if some one is naked, possibly, and that person would not like to approach the person, who is naked.

Well, if that is what is meant by 'offended', I don't know, but it does seem to pose a problem, for people who may feel embarrased by standing close to or talking to, some one who is naked.

What is a Dhourtie? It is a slang term the Lesbianists use for a 'warlock'. The Orson Well's movie, 'Time Machine' portrays ugly, long, greyish white haired, mutant people, who can see in the dark, fairly well, who serve the people on the surface of the planet, with apples, and pears, that the 'warlocks' apparently pick and place out at night to feed to the peaceful people.

The warlocks, then eat the people who live on the surface of the planet once they lure them down into the underground labrynth of underground caves, and tunnels. A 'dhourty' is a Lesbianists' slang term for a 'mutant', or 'warlock'. The peaceful people, who live on the planet, as shown in the movie, are termed, 'Dualdigers', by the Lesbianists. 'Dualdigers' is a slang term for the peaceful, but apparently lazy, sexually attractive, people who live on the surface of the planet.

Some one also makes their clothes for them, as portrayed in the movie, anyway, as the peaceful people, the 'dualdigers', were all clothed, and had neatly groomed hair. They also apparently, regularly, brushed their teeth, and no one got cavities, except for a now and then, unlucky person, perhaps.

The people on the surface of the planet, apparently do not know how to fight, and apparently, never have any thing to do with violence, except for a now and then, quarrel.

Well, regardless of the movie, and its fictitious portrayal of human life, as I don't know any one who acts like those people who are living together, and loving together with each other, so peacefully, the movie is where the terms for 'dhourty' and 'dualdiger' get their start, in slang language, I suppose.

A dualdiger, I explained, before, in my early notes, as an animal, who is a potent, I believe I said it was, who is part plant, and part animal. It is a peculiar looking animal, and it is a silly looking animal. I think the term, 'dualdiger' comes from this animal.

'Dhourty', probably originated, similarly, that is, it is a name for a strange looking animal, a potent, or another of the many types of animals, that are too tiny for us to see, who live in the 'sub molecular' zones, as I was talking about them, before.

Remember, I said there were approximately 600 million zones in the 'molecular levels', or the levels above what we would think is the area where we might be able to find, molecules. There is a cut off point, and below that level, in the lowest of 'molecular zones' there are sub molecular zones.

The zones are living zones, or cosms, as I explained. They are habitats for living organizms. Below that level, the molecular level, cut off level, there are 900 billion zones, or cosms, as I recall I may have said, in the sub-molecular zones, before you get to the bottom.

At the bottom, there may still be smaller animals, living below that level, and I believe there may be, but am not too sure, and I don't know for sure, but if there are animals, living below that zone level at the bottom, they are not as multipously populated, or numerously with such a large number, and large multiple of different types of animals, and they are not that densely populated zones or cosms, living habitats, as the ones above them.

It must be hard for animals to find food, down there, in those such areas, below the bottom. It would appear to us, as the artic, or antarctic, where conditions are difficult, and few things live there, or so it would seem, from what we are shown on television, by the dhourties, the Lesbianists, on this planet.

I don't know what the real story is, below the bottom level zone, but we'll find out, in time, as we begin to study, in the 'Managing My

Universe' program. Now that I mentioned, it, I think there are lots of animals, living in very tiny zones, way down there, but at what levels, those animals are living, I'm not sure. There are many abominated human beings, living in the lower zones, along with the animals in those zones, so just how small people get, and what kinds of animal people they have become, we'll find out more about, once you begin studying in the 'Managing My Universe' program.

The Dhourties And Their Control Of Dualdigers, In Fortresses For Killing Off Dualdigers

The dhourties apparently control society, and they control the County lockup facility, as when I was there, in a 'Dhourtie Fortress' for killing off dualdigers, dhourties were in large numbers, busily beating up inmates, being rude to inmates, torturing them, forcing them to live in cells on cold, hard floors, with no blankets, and with forced ventilation air conditioning, which is very cold.

The air is toxic, and is filled with fumes animals, of all kinds, but primarily, from two sources, as far as I can figure, the one source, being, air coolant fumes. The other source, industrial cleaners fluids. Both are vaporous, and contain high levels of toxic animals. There are also, at the county lockup facility, large numbers of 'asbestos' animals, in the air, that the prison visitors, are forced to breath.

I was nearly choking, on the asbestos animals, by the time I left the facility, at around 8:30 a.m. I was arrested, the night before, and was transported by van, which was picking up other, soon to be visitors, to the facility, for a number of hours, before I arrived at the Clark County Detention Center, the lock up facility for booking 'visitors', after 11 oclock, that evening, I suppose.

It seems there are facilities underground, below the detention facility, where there are tunnels, and 'caves' laboratories, that they house prisoners in, who are then, cruely, and miserably, tortured, eaten, and killed by the dhourties, who run the facilities, and who run the government, and who run our planet.

Even below normal businesses, such as SONY, or Admiral, or Westinghouse, or General Electric, and below the military bases, of course, as well, similarly to the situation below the county lockup facility, and below the New Orleans Hotel and Casino, and below the Home Depot, there are facilities the 'dhourties' have built, to hide and house people, ordinary people, who have been abducted, and who are being tortured, abused, humiliated, criminally assaulted, eaten, and killed by the dhourties, every day, around the world.

There is no country that does not have these facilities, and all government facilities, and all prisons, and all county and city lockup facilities, and all military bases, and all college campuses, and all large public and private schools, have these facilties. There are also

these facilities under civilian housing areas, such as under large housing complexes, where the governments have constructed low income housing for low income wage earners, or ordinary people, the dualdigiers.

This is pretty much the case, nationwide, and world wide, and you will not find a country in the world, with out this set up, constructed by the 'dhourties' who run the governments, and who run, every aspect of society, including, dictating how we piss, and on what kinds of comodes we sit, shit, and piss into.

We are driven and managed by the dhourties, daily, and they are every where. You will not recognize them, as they look like normal people. They are not mutants, not in appearance, any way. They do have brain deficiencies, however, and they are not clever enough to beat me, GOD. Their brain deficiencies, are of the organic kind, and that means, down in the wiring, they have problems, and their brains do not work for them, any more, in lots of ways. They may seem normal, on the surface, but they are far from normal, down in the wiring, as lots of it has short circuited, and there are many blown fuses. They are not capable of knowing what 'common' sense is, these people with brain deficiencies. They can fake it, but in side, when they have a question, as to what they should do, they can not answer it, without the assistance of their code books.

They have numerous codes, and code books, and these are there, to help them manage to survive, and thrive, in the real world, that they created for them selves, and for the dualdigers, to live in.

I have no intention of returning to the Clark County Court House, for my trial, in Justice Court, on Sept. 5, 2007, in less than thirty days, at 7:45 a.m. I have no intention of playing their game of who takes control of whom, as I will not stand for their intolerable system, their societal system, that they have established for the dualdigers to follow.

I didn't mind going into their buildings, before I learned that their buildings are death traps. I am not going to show up for my court trial and play their game of 'footsies', just, as if I can help it, I will never pay taxes to this or any other dhourty government, run by the dhourties, and that is all of the governments, on this planet.

Yes, I have to pay minor taxes, on food and liqour expenses, and on clothing expenses, and so forth. That is taken from me, without any one asking me, if I would like to pay it or not, and I have no choice, but to pay it, or I will not recieve the item, or items, I wish to purchase.

I am not going to stop my naked dancing, that is, my Tai Chi aerobic excercise, religious prayer activities, if I can help it.

I don't think any one is embarrased by being close to a stripper, in a night club, or to a can-can dancer, with little to no clothes on, in

the casinos, that line the strip, here in Las Vegas.

I don't think the ladies, feel embarrased, when they go to the male stripper clubs here in Las Vegas, where the ladies, of all ages, whoop and holler, get all powered up, sexually, and call out at the male stripper dancers to 'Show me more!', etc.

Isn't it peculiar, that the dhourties who live in the drainage system, next to where my camp site is located, in the underground tunnels, systems, complain to the police about my being in 'their' park, and 'dancing' nakedly, and 'jerking off', that is, religiously expelling sacred and holy fluids, as I've expalined about, as well, and acting in a 'bizarre' manner.

Well, I don't think they are being truthful, as they are all dhourties, most of the people calling in, and the dhourties want me off their property, so that they can go on, killing unsuspecting tourists, travelers, down and out people, who may camp out in the park, or who they lure to the park, after making a casual friendship with them.

I will not stand for this, intolerable arrangement in our society, and no one should. The whole area of Downtown Las Vegas, should be leveled, and blown out to expose a wide, gaping hole in the ground, and every facilty of theirs underground, should be destroyed, and turned into dust, rubble, and dirt particles, in the explosion(s).

The underground casino areas, including the New Orleans Hotel and Casino, and all of the other, dhourtie hotel and casino establishments, and their facilities, below them, should also be blasted and each one left as a large gaping hole, using the explosivies formulas, that I have provided on my bulletin board.

I would like to see every single one of the dhourties expelled from this planet, and blown to bits, leaving nothing but traces of their brain wiring, and bits and pieces of their bodies, behind. However, that is impractical, as I will not have any children, among the dhourties, left, on this planet, to practice my religion, after they are introduced to it. It is a religion that will be here forever, and I need people to practice it. I can not go around killing every single shit head kid of mine, and expect to get any where, religiously, after I have killed them all.

Though they may be shit heads, and though their brain wireing, is faulty, and not workable, for them, much of the wiring, any way, and though my 'ordinary' kids, may not be too much better, in terms, of being a human being, I can not go around killing my kids, just because I do not like them, and I do not approve of their behavior.

We will have a justice system, of my own, when we get my children, who have the technologies, to build my criminal justice system, according to Gurkian Law.

I have had enough of their bullshit criminal justice system, that they instituted, and as soon as I can get my religious prayers said, as I do my Tai Chi aerobic excercise religous prayers activities, in the park, from week to week, from month to month, and from year to year, I will get my kids to build my criminal justice system, and I will be seeing the shit head kids of mine, placed into prison cells, and then corrected, before allowing them to be released. That goes for all of the dhourties, and for all of the dualdigers kids of mine, who do not act, properly, and who do not act peaceably.

We have a lot to learn, about my universe, and about the people who are living in my universe. I will have all of them, practicing my religion, in time. There will be no if's, and's, or but's about it, as I am going to make all my children, work for me, whether they like it, or not. I have a long time to get my program, up and running, and these things do not take place, over night. It's one planet, at a time, and in some cases, there are lots of people, interested, in my religion, already, and they are responding, variously, the ones who have the technologies, to be able to look in, and see, from time to time, what all is happening, here on this planet, with me and my religious efforts.

IS THAT CLEAR! I HOPE It IS CLEAR, SAILOR!

Molding Up Bread

Ask your friendly, neighborhood dhourty, who will cooperate with you, for more information, as to how to mold up spices, and flowers, etc., and for information on molds, in general, and so forth, as they know all the secrets, and tricks, to molding up every thing possible, successfully, as they were trained in the molding sciences, and they are all, certified moldists, who can teach you every thing you wish to know about molding sciences, and every thing else you need to know, to feed the organ animals, in your body, for you to regroverate your body, successfully, and for you to get well, from all the illnesses, that the dhourties, have helped you to get sick from. Show them the same kindness they show you, and be kind to them, as you invite them into your underground lairs, where you will be having them stay with you, as sexaling guests, and as teachers, to teach you about the molding sciences, and other sciences, you need to learn about.

Living Forever On Molds, Foods For Feeding Molds Animals, And Sexaling Juices

See my bulletin board, for more information on 'living forever' by eating molds and the foods they eat, to feed your organ animals, the foods they need to feed on, to be healthy, and to allow you to live forever. In addition, you need the male and female sexaling juices in your daily diet, as I've explained, on my bulletin board, which will allow you to get the spare parts, or baby organ animals, and other animals of all kinds, that you need to replace old and worn out, organ animals, etc., in your body with to allow you to live, forever. There is more to this science of regroveration, then I have recalled, so

far, obviously, as this is a complicated science, that involves many things. As I remember this stuff, I will let you know what we've missed. My amnesiatic conditon is not helping me to recall every thing I need to recall, all at once. Find your self a cooperating dhourty, and get their cooperation, and you'll learn more quickly, and accurately. They also have pledged to teach you, all the molding sciences, and so far, they have not been fair, and they have held back this knowledge from you, so you deserve a break, and they must teach you, or they will do jail time, in my prisons, after my kids build them for me.

Clark County Detention Center

It is an odd thing, when they ask you your sex, and if you happen to be a girl, with a dick attached to your body, they call you a 'mixed genitals' person, rather than a 'male', or a 'female'. They do not check to see if male's have vaginas or not, and so only women, get listed as 'mixed genitals' persons. This is very peculiar. I was told to sit on the 'male' side of the room, where only males sit, in the booking intake area. There was a female sitting next to me, and she apparently had a dick, and so they listed her as a 'mixed genitals' person, or a 'GM' for 'genitals mixed', rather than, 'female'. This is very peculiar, as only women are selected for this gender specification. It is not a gender specification, obviously, and the dhourties know it, and they are just goofballing every one, pretending there is some thing about a woman, who has a dick, that some how makes her a non-gender person, and that non-gender person, is a 'mixed genitals' person. She becomes confused, as she is told to sit with males, in the jail house, and she is jailed, I suppose, with males, as well. This is very peculiar, if you ask me, but it seems to be the case. If all men who have vaginas, were placed in a 'mixed genitals' classification, and were then told to sleep together in wards with mixed genitals women, I don't think that would be such a bad idea, but that is not the case, and only women with dicks are told to sleep in wards with males with dicks only, or males with vaginas, as well as dicks.

It is a goof ball situation, in the Clark County Detention Center, and I wonder how they figure their way through this situation.

On the premises of the Clark County Detention Center, the dhourties poison you with fumes animals of all kinds, and asbestos animals, in the lock up facility, and if you happen to develop pains, due to those poisonings, you are out of luck, as you will not be prescribed pain relief medications by the Clark County Detention Center medical staff, as they are not allowed to prescribe to you, a prisoner, any substance that is addictive, unless you have surgery, or unless you have a clear breakage of a bone in your body, such as ribs, arms, fingers, and so forth, or unless you can show that your body is severely damaged, such as from a knife wound, or from an other type of wound you recieved, during a fight, with an inmate, or guard for instance.

I will not be going back to jail, or to the Clark County Detention Center lockup facility, or to any of their lock up facilities, their fortresses for killing off the dualdigers, as that would be a death sentence, and I do not have the karma to die, so I will not be seeing any law enforcement agents, at my door, or in the park, once the Clark County Justice Court issues a bench warrant, for my not showing up for my court and trial date. I am GOD, and if any one could figure it out, I am doing religious prayers, and doing religious prayers, is not a lewd act or lewd conduct, even though I am naked while doing my prayers ceremonies. I was born naked, and I will continue to live, naked, in the shower, and in the bath tub, and when I am changing my clothes, and when I am sexaling, and when I am doing my Tai Chi aerobics prayer ceremony activities. Lewd acts are simply, acts that solicit sexual engagements with others, in the simplest sense, and so a wink would be lewd conduct, and a smile would be lewd conduct, and no one is going to go to jail, for those, except maybe in Muslim countries, where the women wear veils to cover their face, and where they force women and girls to wear gowns to make women and girls appear as if they live in a sack, in many cases.

Lewd Conduct Brings You Closer To GODLYNESS, Or The Love And Chastity, Or The Beauty, Elegance, And Grace Of GOD's Love For My Children

Sexual activities are not within the domain or realm of human beings to cast judgements about. Sexual conduct is not within the domain for human beings to cast judgements about, or to make any opinions about, legal, or otherwise. Why not? Because sexual conduct and sexual activities are devine, sacred, holy acts that can not be looked at in any way other than from the perspective of holyness and the graciality, or gracenesses of GOD, that's me. Graciality is sacred GODLYNESS, or Devine rapture with GOD.

Governments have no jurisdiction or decision making powers or authority over matters that deal with spiritual beingness, and one's relationship with one's creator, GOD, that's me. It's arrogance on the part of any person who thinks that he or she can regulate a person's behavior that brings one into direct contact with one's creator. The karmic scores for this type of mistaken belief and practice, by any one, are high, and the outcome is a punishing one. The penalties for interfering by legislation or by any other means, with a person's rights to live in harmony with one's creator being by advancing one's sexually committed life style of sexaling freely with people and animals to reach a higher state of goodlyness, and grace, and in time, make a closer bond and contact with one's Creator, GOD, that's me, is not a light penalty, and this behavior of legislating out by laws, codes, and regulations the rights of an individual to practice sexually commiting oneself to others by sexaling freely with others for reaching higher states of goodlyness and grace, and contact and closeness with one's Creator Being, that's me, GOD - and I'm the one responsible for all of this, as should be obvious by now - is folly, foolishness, drunken gayety, and ludicrously laughable behavior.

If and when you become devinely raptured with GOD, that is, when you begin to sexually orgasm and erotem or experience sexually orgastic and erotic sensations as a result of sexual mindfulness, and sexual contact with others, you are in the supreme state of graciality, and that means you are one with GOD.

To state any thing about the holy and sacred activities of sexaling, sexual mindfulness, sexual compassion for and with others, other than they are devine act, and acts that brings you closer to GOD, and acts that allow you to breath in the goodness of the GODLY spirit, or the love of GOD in your life, that means, the raptured sexaling orgasming goodlyness of a good orgasm, with full motors engaged, and all orgasming potentials realized, is folly and ignorance based behavior.

For humans to comment on rapturing with GOD in a sense of, is it good or is it bad, is sheer nonsense, and unacceptable, by any standards. It is a devine act that brings you closer to your creator. To say sexaling is this way, or that way, and so there fore, we are going to prohibit it, and so forth, is sheer lunacy, and not a notion that can be universally accepted as a reasonable statement by a reasonable person. It is the banter of minds that are insane, that state such remarks.

Sexual Compassion For And With Others And For And With Self

Sexual compassion for and with others, are the actions of engaging others to sexually erotemize them, and in so doing, to erotemize oneself, and to sexually orgasm others, and to orgasm oneself, for the sake of clearing up, or cleansing their and your karmic distresses, or karmic failures. Karmic failures are the naughtynesses, or misbegotten, mindless, dhourty like, animalistic behaviors, that lack compassion, and that lack mindfulness, and which is rife and riddled with jest and gayety directed at the victims of their torture sessions. This is mistaken, mindless, and uncompassionate behavior that causes undue and unjust suffereings and miseries to others, and draws one and all of my chidren further away from their relationship with their Creator Being, that's me, GOD.

Balancing Out Karma, It Is My Way, Or Thou Shalt Takeeth The Highway! And Getteth Thoun Self Out Of My Universe!

On the one hand, there is a need to balance out one's karma by engaging a person's life, and by bringing that person to a point of suffering where at the mathmatical formula for balancing out karma, and cleansing a person of his or her karma, will be satisfied. This need to balance out one's karma is based on a mathmatical formula, that must be followed, to allow people to balance out their karma, so that they can live as a nearly decent human being.

The need to engage others, in retributional recoursivistic actions, for the sake of balancing out their karma for them, is a compassionate act, that can be done with passion, and compassion, if one's mind is a 'pure' mind, and the mind of GOD, that's me, John Francis Ayres.

Only my mind is pure enough, and capable of GODLY passion for my children, that will bring a proper result to the lives of my children for balancing out their karma. The dhourty menacers, think they are mini gods, and they think it is their right and obligation, as stated in their code books, to help others with their karma, and so they are always, brutally punishing and tortureing others.

There is a long history to this, that will help explain how this got started, and I am partly to blame for their beginings as an organization, as I helped design and write their code books. It is not clear in my memories how much I helped them to get their start, but as a sexaling lay organization, they had and have the right to make their own code books, that follow basic premises, established by me, long ago.

Their behavior is too far out of line, but I used them as a supplemental assistive group of persons to assist me, in many ways, to allow my children to get their karma straigtened out. It was and is an imperfect organization, as it is run by imperfectly minded people. It is time to disband their organization, as now, in the Gurkian Age, there will be no other methods allowed for straightening out people's karma, other than the one's that I insist on, the ones that I implement with the assistance of my working children, the ones that I will use, to straighten out my childrens' karma, over time, as we progress along to the future.

The Ludicrousness Of Playing 'Footsies' With The Insanity Driven Dhourty Government

For me to contest a charge of 'lewd conduct' with the insanity driven Dhourty government is not an act that I will be engaging myself in. By insanity driven, I mean they believe they are all mini gods, and they believe they have the ultimate right to determine others' destiny. This is sheer insanity, and they are all mentally ill, and that will be proven, once you begin your studies in the programs that I and my working children have lined up for you to study and participate in.

What Is Lewd Conduct?

Lewd conduct is an act, that draws others to a higher state of knowing GOD, in that if you engage in a sexaling act, as a result of 'lewd conduct', or the act of soliciting others to make a sexual statement, or that is, to solicit others to commit them selves to a sexual activity, or action, for me to contest a charge, of 'lewd conduct', as I was saying, is sheer nonsense, and ludicrous behavior, and it is not in the domain of human beings to condemn 'lewd conduct' as lewd conduct is grateful to GODLYNESS conduct, as lewd conduct, and lewd behavior of sexaling with others, which is also a type of lewd conduct, is a sure way to reach higher states of grace, and that means, you grow closer in contact with your creator as a result of your lewd conduct.

Gratefulness to GODLYNESS is a condition of being enraptured during the sexaling orgasming phase of sexual and erotic thrills inducing activities. The ejaculation and orgasming of males, and the orgasming and ejaculation of females, and the running or flowing of the sexaling juices from a females' body brings on a higher state of grace, and it brings you closer to your pure, devine, self as a 'child of GOD', and I am GOD, and I know this kind of stuff, so take my word for it, and get your brains, unbrainwashed, and get your dicks and vaginas busy, and learn what purity of self is all about as you sexal for weeks, and months, and years, non stop.

The longer you sexal, the higher you will go, in terms of reaching a higher state of closeness to your Creator, that's me, GOD. For the dhourities to unfuck up them selves and their brains, and for the dualdigers to unfuck up them selves and their brains, and for them all to get their act together, to where they can appreciate the higher states of GODLYNESS, will take some time, maybe a few kabillions plus years, or more. I am, technically, a dualdiger, and so I am also in that lot, but I have an advantage, in that I am GOD, and it is easy for me to stay pointed in the correct direction, for gaining a higher sense or appreciation, over time, for the Love Of GOD, as my brain is minorly connected to that state of being. There is a connection, in my brain, that will carry me forward, and that will allow me to lead all of my children, to this higher level or state, or condition of beingness in harmony with the Love Of GOD, over the years we are sexaling together, in my religion, during my religious ceremonies and all of my religious activities, forever.

With your experiences of coming closer to GODLYNESS, your life becomes purer, and your karmic records that you carry in your body, hidden behind the particals in your body, on different layers, or dimensionalities, and you can learn more about this, in the courses we offer, for you to learn to sexal for a living, and so forth, the records you carry begin to disintegrate, and they pale or loose their sharp, duralangular edges, is one way of looking at it.

Duralangular edges is a term used in math, and I'm not familiar with it, but it must be something to do with geometric shapes. In any case, the edges sharp off, and that means, they drop off, and begin to form more loose, or flowing, curvatures, as they disintegrate. Think of a box with sharp edges. If the box is beaten on the edges, the box will loose the sharpness of the edges, and slowly, if you beat at the edges of the box, long enough, the box will begin to crumble. Well, it is sort of the same thing, and your karmic records have these types of geometric shapes to them, as we package things to do with your karma, in tiny containers, and then affix them to your karmic records. This sounds peculiar, but we have a way of doing it, and it works well, and we can disintegrate these 'packages' or capsules, and as we do, we straighten out or make lighter, your karma. This needs further explaining, but you'll study it in your courses, when you begin to study for the various programs we have for you to take and learn about how things work and about how things are in my universe.

The sharp edges are slowly, very gradually, lost, or smoothed off, and your karma changes, slowly, very gradually, as you acquire more and more knowing GODLYNESS, and knowing GOD experiences for your self, as you orgasm your way to blissful, purity.

It takes a lot of coming closer to GODLYNESS experiences to do anything significant for your karma, and for cleansing the karmic records in your life, the ones that are hidden in the dimensionalities behind the particals that make up your body. There are layers and layers of dimensionalities, and they nearly go on, forever. There is a limit to them, however, and between this dimensionality, and the final dimensionality, you have huge, and vast store houses of stockpiled karmic records. We find lots of places to hide them, and you won't believe how long it is going to take you to get all your karmic records that are stored not only in the layers below the particals in your body, but elsewhere, through out my whole and entire universe, behind the particals or in layers of dimensionalities, under the particals, that exist as matter, and as types of energies, and as types of many other things, throughout my universe.

Storing And Dealing With Your Karmic Records

Your records are stored from here to kalamazoo Michigan, and that is a phrase that says, they are every where, and the amount of time needed to erase them all, and deal with them all, bit by bit, is quite large. We've been here, a long time, and we've stored up your karmic records, every where. If you think this is a simple job of erasing your karmic records, you are mistaken, and you had better prepare your self for a long term, and long haul project for erasing your karmic records. Though the process of cleansing your karmic records is slow and gradual, through the knowing of GODLYNESS experiences you acquire, over time, the cleansing effects do occur, and your karmic burden is reduced, a tiny bit. You have stockpiles and stockpiles of karmic records, and we have found every imaginable way of storing them, and we have shrunken them down, to pint sized records, that are very tiny, and we have the technologies to do this, and we can resize them, and then place them inside of the holding cells, in the many dimensionalities behind, or underneath of the particals in your body, and in your vicinity where you live, and near the planet where you live on, way out to very far away from your planet, to nearly half or so away across the universe, the current sized one, or nearly that far. Your karmic records that interplay with your life, at the moment, are stored out that far, and we have others, stored and hidden elsewhere, as well, that are just sitting there, waiting to be dealt with. Our placing of your karmic records, along with every one elses, in this manner, deterimines what your karma is.

With this storage method, it keeps your records where we want them to be, for us to be able to determine what your karma is, and for us to be able with my religion, and with your religious activities, of sexaling with your self, with others, and with your sexaling with animals, as sexaling is sexaling, and there is no distinguishing of

the effects of sexaling. That is, your sexaling brings you closer to GODLYNESS, no matter if you sexal with an ape, or baboon, or with a monkey, or pet goose, or neighbor, or sister or brother, or your child, or mother or father, or the conductor on the train, or subway, or the stewardesses and stewards in the airplanes you fly in, or on the trains you travel and commute to work in, or on the cruise ships you vacation on, those of you with a little money, or with the workers in the casinos and restaraunts that you frequent, if you happen to live in Las Vegas, or other places where casinos are a part of the local life style, and so forth, with your sexaling experiences of coming closer to GODLYNESS, as you orgasm, and as you pulsate with energies that purify your life, these energies, and other energies my kids have a lot to do with, in the transporting of them to you, during your religious activities, and other things that are like energies that also cleanse your karma, but that need further clarification as to what they are, these energies, etc., erase your karmic records, in a priority determined manner with your karmic records stored in this manner as described. You will learn more about this, in detail, as you begin your studies once you have access to the software package that the FBI, and government agencies are in the possession of, as I've explained about.

For the present, I am stuck in a swamp like sand box, a parcel of land, inhabited by dhourties, who are assasins, and killers for hire, who work hand in hand with the dhourty police, and dhourty members of law enforcement, and their dhourty staff. Dhourty hospitals also work hand in hand with the tunnel rat association of dhourty assasins and killers for hire, and with the dhourty police and their dhourty friends, and dhourty advisors. All dhourties work with one and another, in their local area, and they are generally, well connected with each other, in that local area, but only a few of them know about what is going on, with myself, GOD, and with my battle to over throw the dhourty led governments of the world.

The Dhourties Are Not Informed As To What I Am Doing, And Few Of Them, Know Any Thing At All About Me

There is no TV or media broadcasting about what I am doing, and they only have their 'propaganda' TV to watch and to gain information from, in addition to their 'propaganda' news papers, and 'propaganda' news magazines. They do not exchange much information, as they are prohibited from discussing business, except in the underground 'fortresses', the 'torture' facilities for torturing the dualdigers. Even in those locations, they do not generally discuss anything to do with business as usual types of stuff. Only important topics or issues, such as John Ayres trying to destroy the Lesbianists, or similar topics of importance, are allowed, and not much discussion of any thing of interest, is exchanged by them, even in private. They are busy with torturing the dualdigers, and it is a waste of time, to discuss private, personal, or local issues, and even state or national issues, and they are not allowed by their code books, to discuss

'wasteful' of time, issues with each other, while they are on their tour of duty.

Lewd Conduct Should Be Advanced, Not Prohibited, In A Sane Society

Lewd conduct should be advanced in any society, that has a sane, municipalator, or manager in charge of laws and criminalities, and not 'condemed' as is the way it is handled in this society. This will lead to the detieroration of and the disintegration of human relationships, and it will end all possiblities that people have of attaining a higher standard of spiritual beingness, or spiritual goodlyness engaged in a love relationship with one's creator. The action of sexaling brings about a state of euphoria, but in that euphoria, there is a holyness that is hard to penetrate into and perceive, as sexaling in our demented and twisted minded society, is a condemned activity, and that is clearly brain washed into every one's minds, as that is a propaganda ploy of the Lesbianists, the dhourties. Arresting ladies who sexal for a living, is one propaganda technique the Lesbianists use to alter the minds of people. Christian values, of, sexal only with one's spouse, is saying, you can not sexal with others and if you do, you will be committing a wrongful act. That is also clearly stated in Christian concepts, and it is another brain washing technique, not to mention, a most devious one, that is highly rewarded, with maximum penalties, in my karmic score card approach to managing my universe, and you will learn more about that, when you begin your 'Managing My Universe' course work, and you will also learn about it, as you go along, and learn the principals of my religions, past, and present.

Lewd conduct is not a topic I will discuss with prosecuting attornies, or with DA's, or with judges, or with police, as they are not qualified to say a word about the realm of GODLYNESS, in their inferior roles as varmint hunters, or criminal watchers, and on this planet, as criminal torturers and killers. They are not fit, the Lesbianists, mentally, to judge or determine the value of sexaling. They are so anti-sexaling in their actions and words, and they are so incredibly twisted up in their brains with regards to sexaling, they will never come any where near me, or close to me, not one of them, as they are too twisted in their minds, to be allowed by my children, to come any where near me.

The joke the Lesbianists promote about sexaling, where they publicly condem it, and privately enjoy sexaling with their co-worker dhourties, is a big joke, the dhourties are playing on you, and you are being goof balled, here, as well, into believeing that sexual promiscuity is a 'bad' thing. You are a fool if you believe that, and I am here to change all of that negative thinking, that you are burdened with, that the dhourties have fooled you into beliveing, if you in fact, do believe that sexual promiscuity is a 'negative' thing, as that, as I've explained, is the only way for you to erase your karma, and to ease the burden of karma in your life.

Like it or not, if I had wanted you to wear clothes when you were born, I would have designed your bodies to have clothes on them, when you were born. Your skin is your clothes, and it is only a matter of time before you realize it. I did not design your bodies with any other clothes on them, for your birth, and so, all you need to live in, in moderate climates, is your skin and hair. That is all you need and you will all get used to it, one day, living in your skin, and hair, only, after you begin working for me, sexaling for a living, as I have explained about.

You are all going to work for me, erasing karma, from now on, by sexaling, as soon as I get my religious ministry, established. My kids will be building the facilities for you to live and work in. When they will begin building the facilities for you to live and work in, is the question, that I do not have an answer for. But I am praying, that it will be as soon as possible, as I do not need to be surrounded by dhourty jerks in the park, who call the police every time I arrive to do my Tai Chi aerobics excercises religious prayer ceremonies.

The dhourties in the park, and the dhourties at the police station, and in the Clark County Detention Center, are all partners, who work hand in hand, along with police department, sheriff's department, and other law enforcement clerical dhourties, law enforcement dhourty judges, and prosecuting attorney dhourties. We are surrounded by the dhourties, in government, such as all the politicians running for president, and all the politicians running for vice president, including, former mayor Guiliani, who was with other dhourties, primarily responsible for the World Trade Tower bombing, as I've explained about.

These dhourties, and their dhourty friends, in society, account for a large segment of our society. The ordinary people, for the most part, former Lesbianists, i.e., dhourties, in previous lifes, are another large segment of our population. One other segment, is my, what I call, my public sector service workers, animal people, who eat and torture dhourties, and others, who need their karma balanced out.

The dhourties are well aware of these animal people, and there are some dhourties, who can not function, brainally, very well, and these dhourties who can not function brainally very well, are not that different from these animal people, as they both do the same basic thing, and that is torture people, and torturing people helps to balance out karma.

We are in a new age, the Gurkian Age, and I have a whole new religious program, for balancing out karma, and you will all participate in it, if you want to balance out your karma, and if you want to erase your karma, and you will be in this religious program, for eternity, sexaling with each other, as I have already explained.

Organ Animals And Sexaling

I mentioned the organ animals and their ability to make notational thoughts to your brain. The 'I need sex' 'I need sex' drive in your pants, or panties, on the front side of your groin, or on the underside of your groin, or in your butt hole, the urging out, of 'I need sex' 'I need sex', or in the boobies of women and girls, the urging, 'I need sex' 'I need sex', they are all notational thoughts from the sexaling organ animals in your body. Let's get used to this fact, and grow up, and deal with things, logically. They are calling out for our assistance. They want love and affection. They are hungry for love and affection. I put them in your body the way they are so they will help you in your daily activities of sexaling. Now let's get real, and let's pet those organ animals, when they call out, saying, 'I want sex, please pet me now!' It's be kind to organ animals week, this week and every week from now on, until we learn to be helpful to all of our sexaling organ animals who need petting, and until we learn to be comfortable with our sexuality. Let's get real, and let's get the governments of the world to strike down the laws regarding sexuality, nakedity, and sex between younger people and older people, and let's also get the governments of the world to strike down all the laws regarding the use of opiates, and aphrodesics in our daily diet and in our quest to get healthier. We need these in our diet, as I've mentioned before, and we will push ahead until we get the dhourty governments of the world to listen to us, and then to comply.

All Hands At The Quarter! Ready Your Weapons! Off Shoot Now!

That means, get to your stations, and prepare to fight. Get your weapons in firing order. Discharge your weapons.

That means, get naked, get your dicks, scrotums, your vaginas, labia, all your sexaling equipment, such as your titties, your chests, your pelvises, your hips, your tummies, your groins, your butt cracks, your butt holes, your shanks, your backs, yopur shoulders, your necks, your under arms, your feet, your palms, your toes, your fingers, your tounges, your lips, your mouths, your throats, etc., and get every little or big organ animal in your body that is hiding in you, to work, working for you, as they are all designed and built for you to use for sexaling enjoyment, and that body you are in, is designed and built to be used for sexaling with your self, with others, as well as with animals, and get ready to use them, and get using them, now.

Keep Firing Till Ordered Otherwise!

That means, do not stop sexaling, till you are ordered to.

Captain Off The Bridge.

Eyes, Ears, Noses, Throats, Tummies, Buttholes, Dicks, Vaginas, Expeller Ports, And Who Knows What Else, Oh My! - Subtle Ways Of Brain Washing People - What Is Sodomy? - Societal Brain Washing - Hair Ports

- Teeth Ports Updated: 11-08-07 Rev.b 05:50

Eyes, Ears, Noses, Throats, Tummies, Buttholes, Dicks, Vaginas, Expeller Ports, And Who Knows What Else, Oh My!

Did you know that we have lots of organ animals inside of us? We do. And do you know what else? Each one of them, has its own brain. It has lots of brains inside of it, and each one does a particular function, or maybe many functions. Probably lots of functions, I suppose. In any case, each one has eyes, and each one has a nose, one or more, and each one has a mouth, and each one has ears, and each one has a throat, one or more, and each one has a butt hole, and a dick, or a vagina, or maybe both, or maybe something in between, or maybe, some thing that is not like a dick or a vagina, and is not in between, but it is some thing that is wholely and entirely different from any thing we are familiar with as far as reproductive organs go.

They also have tummies, and expeller ports, which are ports or openings, that help them to expate the juices that there are inside of them. What does expate mean? I think it means, to spit out. They expate, or spit out, all kinds of juices, from lots of expeller ports, or expeller opening holes, that open and close, and when they open, juices come drooling out of them, and when they close, the juices stop coming out, and the fluids drool and drain off and go some where, such as down a via duct, or a channel, and out into a pool, where there are animals, swimming, and snorkeling, and looking for food to eat.

Anyway, it's a confusing world, inside the body, if you don't go into it, and look around for your self, at all the possible hiding places, there are animals hiding, and eating up one and another.

We can look inside, and that is much safer, with microscope technologies that will allow us to look inside, into all the different habitats that there are, where animals are living, eating, making children by themselves or with others who are like them, and so forth.

There are all kinds of odd creatures living inside of us, and we haven't even begun to understand who is in there, and what they are all doing. I think we need the cooperation of the governments of the world, the dhourty governments, that I've explained about, and when they give us a little cooperation, we can build the types of microscopic technologies we need to look inside of our bodies, and see all the little animals that are moving about, and eating, drinking, swimming, fooling around, walking around, and just playing around, or making love with one and another, to make babies.

Did you know, too, that there are optical nerves, that are a little like optic fibers, and they connect many of the organ animals inside of us, up to optic cirtcuits that then allow them to see out side of our body.

That means, they can see the world around us. Did you know our whole body is covered with microscopic, and smaller, optic ports, or viewing

windows, and viewing ports, to allow the organ animals inside of our bodies to see out side the human body.

It's true. There are also nerves that are channels, like optic ports, but they are sensory ports of different kinds. These sensory ports also connect the organ animals up to the skin of our bodies, so they can smell the fresh air around us, and these sensory nerves act like little noses, and they are all over our body, in smaller than microscopic sizes, as well.

There are also sensory nerves that function as ears, for the organ animals, and they are connected up to the skin of our body, so that the organ animals can hear things, that are going on, around us.

There are other sensory nerves, that connect organ animals up to the surface of our skin, and these sensory nerves, allow for communication with other organ animals in other people's bodies.

The organ animals all see each other, the outsides of each other, and they can even see inside of your body, with special heat wave signatures, and other technologies, that allow them to peer inside of your body, and then see their organ animal friends, more up close.

That means, they can see each other, and they can talk with each other. They have sensory nerves that transmit code to the special ears of the other organ animals who they wish to speak with, and the special ears of the other organ animals pick up different frequencies, and different coding structures, and then they can communicate back and forth with each other.

You didn't know that, did you. Well, it is a secret the Lesbianists, or dhourties, do not want the dualdigers to know about. Do you know why? Because, their Christian bullshit is just that. A pile of bull shit. Not only that, but their sciences are all full of shit, too. If you know that there are organ animals who want to see out side your body, and view and communicate with other organ animals, who are in other people's bodies, then you will want to allow them to hear as best as they can, and you will want them to see as best as they can, and you will want to let them smell the fragrances outside your body, of other organ animals, as best as they can, and so forth, and that means, you will want to take your clothes off to allow them to see outside, and hear outside, and smell outside, and speak outside to other organ animals, with no interference from your clothes, and skirts, and pants, and underpants, blouses, bras, shirts, socks, shoes, jackets, handbags, brief cases, and so forth.

You would want to stay naked, as much as possible, because that was how I designed you to be. Did you know that? Well, it is true. We have to let the organ animals inside of our bodies get as much fresh air, and as much sunlight, and as much sensory input as possible, from the outside world, and from other organ animals, for them to be happy, living and working where they do, inside of our bodies.

Does that make sense to you? I hope it does, because we are all mistaken in our beliefs that we must wear clothes.

Nudity promotes the health of the organ animals, inside of our bodies, both mentally, emotionally, spiritually, and sexually. They get turned on by the fragrances of other organ animals, and by the sights as they look at other organ animals, working in your body, and at the figures of other organ animals, and at the sexy looking sexaling ports, or dick and vaginas, of other organ animals. They are like puppy dogs, in a way, but much more complicated, and much more intelligent, many of them, any way.

They have complicated code structures, that allow them to speak back and forth with other organ animals, in ways that allow them to tell jokes, and to tell funny stories, and to sing songs, and to teach other organ animals who are like them, about things they know about.

Not many of you may know this, but all the dhourties know this. They have to keep it a secret from you, so that you can continue in your ignorance, thinking you are 'created in the likeness of god' which is total bull shit and trash.

Well, now that we understand that much, it is time to investigate and get this all cleared up. Now how do we investigate this? I don't know, but maybe when we get the cooperation of the dhourties in government, we will get some software from them, the software that I handed to them, or the software that they have hidden away in secret filing cabinets, which they can allow you to use, to see inside your body, and investigate all these things.

Do you think the organ animals like being trapped inside of your body, unable to see out side, or hear outside, or speak to others, outside, because you live so far away from each other, and you live in tiny boxes, homes, or houses, or apartments, and condominiums, etc., where you live by your self, separated from others.

I don't think they are very happy that you are all living in your tiny boxes, which serve as homes for you, where you live by your self, much of the time, and you pay no attention to the needs of the organ animals.

They need light, sun, shade, coolness, brisk breezes, and the scents and smells of other organ animals, and the nearness of others, to them, so they can communicate and chat back and forth with their friends, the other organ animals in other peoples' bodies.

You need to marry each other in large groups, in other words, and you need to stay togehther in large groups, and you need to be naked, twenty four hours a day, in large groups, and you need to go out side and play naked, in the sunlight, with others in your groups, and with others from other groups, to allow your organ animals to get all the opportunities to meet with new people, other organ animals, who are as intelligent as they are.

Did you think you were the only intelligent people in the whole universe? Well, some of my organ animals are almost just as intelligent as you are.

In some ways, they are as intelligent as you are. Did you know that? How does that make you feel. You have a cooped up organ animal, lots of them, inside your body, who you do not even know about, and they are all wanting to make friends with other organ animals, and they are all wanting to meet with other organ animals, while they work for me, and for you, inside of your body.

Well, the little secret of the dhourties, this one, any way, is now out and open to the public, and you can make of it, what you want, and you can either research it, and learn about the facts of this, or you can deny it, in ignorance, because you think 'Jesus saves' and you think 'god' or 'allah' is going to make you a nice home, after you die. What garbage talk.

The dhourties have made you swallow their garbage talk, all this time, and they have been fooling you, and they have been rejuvenating their bodies, and then playing as if they were some kind of watch person, or care taker, who could decide your futures for you.

Well, I don't think Hillary Clinton, or Barack Obama, or any of the other dhourty government leaders who are running for a presidential candidacy, or for a vice presidential candidacy, is going to like the news that you now know what is going on, a little more than before, inside of your body, and that you are about to reject their religious garbage talk, and all of their sciences garbage talk, and all of their statutes garbage talk, that help to keep you in check, and in line, and that keep you going, working and growing older, day after day, paying the taxes for maintaining their livelyhood, while they have a way to rejuvenate themselves, as professional moldists, and while you have nothing, other than a token watch for working thirty, or more years, devoted to the company, before you were released from work, with a meager pension, to find a grave yard plot, for placing your bones in, after you die, and go back to my Epcot Center, for refurbishing, and for making you as good as new, nearly, for your release as a new tummy baby, back to one of your former neighbors, or former relatives, as a new baby.

Isn't that about the stupidist thing you've ever heard of? And isn't that a joke. Well, they get away with it, every day, and the dhourties who support them, organizationally, are in on it with them, and none of them deserve much of a nice smile, or any thing else, for that matter, for all their mean jokes and tricks that they have played on you.

That means, go right ahead, and kill them all, as I do not care any more, about any of these dhourty kids of mine, unless they are willing to cooperate with all of my dualdiger kids. Do you understand that? Go to the dhourty courthouses, and blow them up, and go to the police stations, and jails, and prisons, and blow them all up, and medical

hospitals are other big places which dhourties like to torture dualdiger kids of mine, under them, and even in secret rooms, in them, and so are universities and colleges, and large schools, and low income housing projects, government buildings of all kinds, and blow all of them up, along with the Pentagon, Fort Knox, and so on.

We have to get the dhourties in government to cooperate, and to do that, we need to send them a message. So if you wish to blow Washington, D.C., out of the surrounding area, and level the white house, and every one in it, then go right ahead. You have my explosive formulas, on my bulletin board, so go right ahead, and do what you think is right.

Now, we need the cooperating dhourties, to tell us every thing, and we want them to cooperate with us, as quickly as possible. Are you listening, Mr., And Mrs. Dhourties? You had better be, as some people may not like you, very much.

When the organ animals all get charged up, then you, your self, get charged up. Did you know that? You bet it is the truth. When your organ animals spot a pretty looking girl, if you are a boy, or if you are a girl and your organ animals spot an attractive looking guy, then your organ animals inside of you leap into the air, almost, and they are saying, 'I want to sexal with that person.'

If you are a girl, you begin drooling out of the vagina, and your body stiffens up in many places, and you get firm, and ready for sexaling with the other person. Other things, such as hard titties, and hard tittie nipples firm up, and your butt muscles firm up, and your vagina swells up, and your organ animals are all saying, 'Let's go for it.' What fools we are to ignore our organ animals. If you are a boy, your dick gets firm, and you get a big one. That is a hard dick that inflates and grows large.

Subtle Ways Of Brain Washing People

It is in the Christian teachings and Muslim teachings that say, we shouldn't go around, looking with 'roving eyes' and, we must not look women and girls in the face, in the muslim countries. They teach about 'lewdness' which is a totally made up, fictitious concept of theirs, as there is no such thing as lewdness, and they only make us think there is, with their unique, deceptive, and tricky brain washing techniques that they use in the mass media, and in schools, and in churches, and in synagogues, and in mosques, and so forth. Saying 'incest' is a bad thing, or that 'sex with a minor' is a bad thing, or that 'casual sex' is a bad thing, and only 'loose women' have casual sex with others, or 'tramps', and calling girls 'sluts' and 'whores', and using words like 'mother fucker' as a way of saying the person is a bad person, or using the word, 'rape', or 'gang rape', to mean some thing 'bad' happened, or in the same way to use the words, 'sodomy' or to 'sodomize' another, to mean some thing that was against rules of some 'abstract' 'god', or something, who supposedly left a bunch of

rules to live by which are in the quoran, or bible, or Judaic texts, and so forth, all these examples are used to subtly brain wash us, into thinking that sexing is an area of life, that we had better be careful with, because if we are not, we may end up breaking a law, or we may end up being sent to jail, or we may end up being shot by someone who does not approve of our behavior.

What Is Sodomy?

So called, 'sodomy' or, poking some one in the butt hole with one's dick, without the person's permission, is not a nice thing, but if you ask, and if the person says, yes, fine, then, you need to massage the butt hole, for half an hour or so, or in some cases, a little longer, till you make the butt hole muscles relax. When they are relaxed, and after the person has pooped out the poopy, lumpy stuff in the butt hole channel, or the rectal column, or descending colon, is another word for rectal column, and I've talked about the 'shank' in an earlier post, and you should read it, once the shank, or butt hole tube is loosened up by massaging the opening hole, the butt hole, suffiently, then it is easy to slip in a dick, and women have dicks - unless the doctors at the birthing hospital, cut off the baby girl's dick when she was born, saying, 'The little baby girl will never be able to find a husband, if she has a man's dick on her body' and with that, they often just do surgery, and cut off the dick, and close up the pee tube hole, and then pretend like nothing happened, and the mother and father never even tell the girl she had a dick when she was born - and girls and women like to slip their dicks into the butt hole tube, also, and they like to ejaculate into the butt hole tube and orgasm as they ejaculate and as they sexal boys and girls, and men and women, with one's dick inserted into the butt hole tube, which feels like a vagina, and is generally the same type of thing as a vagina, except it is not for baby making, but it is for sexaling with others, as I've explained, and men and boys like to sexal or put their dicks into the butt hole tube, and eventually ejaculate, and orgasm, as well, and there is nothing wrong with it, and it brings you closer to 'GOD', that's me, as you orgasm, as I've explained. The butt hole tube begins to leak sexaling juices, as you sexal it with your dick inserted into it, and that is a natural phenomena, and no one can deny that the juices that leak out of the butt hole are sexaling juices. So 'sodomy' is just another bull shit idea of the dhourties, who wanted to make sexaling between men and boys, and between women and girls, 'illegal', and then use that, to subtley brain wash people that sexing the butt hole is a 'no no', and you may go to 'jail' if you sexal the butt hole, and get caught doing it. Aren't the dhourty kids of mine, stupid? Did they think they could keep this a secret, that sexing the butt hole tube, is a pleasureable experience, and once you get used to it, your capabilities for sexually orgasming, double and triple, and even go higher, as you can sexal the butt hole tube, for days and days, and with many partners, and it can go on for weeks, and weeks, non stop, especially in women and in girls, who can sleep, with one eye partially open, while sexaling all night, if the partners are

quite enough. You can orgasm so many times, one after another, after another, after two and a half weeks, to four weeks of sexaling the butt hole tube, day and night, and orgasms will continue, non stop, and soon, you will not want to stop, and if you continue for long enough, you will eventually pass out from orgasming so many times. So, 'sodomy' no matter how you look at it, or gang rape of the butt hole tube, is a good thing, and it brings you closer to GOD, that's me, but you have to ask the person for permission, to do it correctly, and you can not force your self on the other person, as that is called, assaulting another person, and that is not a good thing, so ask, first, and if the person says, okay' then it should be perfectly alright, but just don't tell the police, or your school yard security officer, since they will report you to the district attorney, and you'll get arrested for some stupid crap, bullshit, legalistic nonsensical, dhourty minded, cheap trick they are using against you, to stop you from having a good time, sexaling. Aren't they idiots. Well we are going to clear up, all of this, and in time, all women and girls, and all men and boys, will learn that sexaling the butt hole tube, is a fun thing to do, and a fun sport, for men and boys to engage in, and a fun way of sexaling for women and girls to engage in, and in time, you'll all love sexaling the butt hole tube. And you girls and women who had your dicks cut off, before you were old enough to say whether you wished to have it on your body, or not, which is kind of a nutty thing to think about, as of course, you would want your hands attached to your body, and of course you would want all your limbs attached to your body, and the dick is just another limb, but it is a very important limb, because it can help you to draw closer to GOD, that's me, as you sexal with your dick, you girls and women, who had your dicks cut off, you can eventually grow them back, as I've explained about, before, using tissue and organ regrowth molds and foods for the molds, which will make the organ animals begin to make babies, so that your dick grows back, eventually. It may take some time, but little by little, it will grow back. The dhourty girls and women, who come out for a tour of duty, always have their dicks cut off, so that they can fool people into thinking that they were not born with a dick. It is one of the Lesbianists' rules that they cut their dicks off, before they come out for a tour of duty. Ask one of them, and you'll see that I'm right about this. They grow it back, once their tour of duty is up, and once they have a suitable place to live, where they can live for the next, few thousand years, while their bodies repair them selves. It takes a few thousand years for a dick to grow back, completely, or nearly that long, but once it grows back, it is usually as good as new. Seldom is it not good as new, and only if the person has some kind of karmic problem, will it not grow back, perfectly. That's very seldom, but it does happen. You can try again, after you sexal a long time, and you will be able to erase your negative karma, that keeps you from having a perfectly formed dick to sexal with, if your dick does not grow back, perfectly, the first time. In time, after you erase your karma, enough, your dick will begin to shape up into a perfectly formed dick, but it takes a long

time, to get it perfect, so don't worry, as we will be here, for ever, and we will be sexaling for ever, as this is a new age, the Gurkian Age, and we are going to be sexaling for ever, from now on, all of you, and me, too.

Societal Brain Washing

These tricks with words the dhourty kids play on us and use in the media, is societal brain washing, and there are other types of brain washing they use, such as in sunday school, by saying 'the lord said that you should be chaste and love only your one wife' or something to that effect, or that 'you should love, have sex, and have children with only your "legally married to you and sanctioned by the government, and here is a piece of paper to prove it" husband'. Well, there are still other ways of brain washing you, by showing you how in muslim countries, how strict people are about sexing with others who they are not married to. This is subtle brain washing they use in the media to try and scare you into following the rules they set up for you to follow. They think you and I are fools, and that you and I will not question their authority, but that is now all coming to an end. That means, it is the end of an age, a long age, from the very begining of our time in this universe, and we are starting a new age, the Gurkian Age, and we are going to start all over, and right all the wrongs, and get every thing corrected that needs correcting.

When you live a healthy life, with full nakedity, daily, every day of the year, you begin to charge up the organ animals, inside of your body, and when you live and work with others, in large groups of people, who are also naked, twenty four hours a day, seven days a week, you and they all begin to get charged up by your organ animals. It is no secret, that if they feel good, then you feel good. If they feel invigorated, and sexually charged up, then you will feel invigorated, and sexually charged up.

What fools we are, not to know this. I don't mean, you, my dualdiger kids, but it seems we should all know this, as it would be common sense, if we were taught this in the public school system.

We are not given the chance to know about this, as the dhourties are all too secretive, and they like feeding us their garbage talk, their school teachers, and their professors, and their sunday school teachers, and their law enforcement workers, and their judges, and their government administrators, and so forth. I think we should get rid of them all, and start out, fresh, but that isn't the way to go, as we want to get them to cooperate with us, and to do that, we need to invite them into your homes, into the play time dungeon cells, where you can have them teach you all the secrets to sexaling, and all the interesting information on living long, and prolonging our lives, with molds, and foods for molds, that feed our organ animals, and allow us to live forever as the organ animals, reproduce, as well as the secret about where we can get spare body parts from, which is from the sexaling juices of men and women, and even animals.

Well, it is about time, we started to find out the truth about all of this, and if we do not get the cooperation of the dhourties in government, pretty soon, there are going to be a lot of angry people, pretty soon, as word of all of this, begins to spread from person to person, as the dhourty news companies, the brain washing media companies, with their bullshit news stories about 'incest' and about, 'lewdness', and about, 'prince charles and his latest secret sex scandal', and so on, all the petty bull shit garbage talk they make us swallow, as interesting news stories, which secretly send messages to our brains, that sexaling is a 'no no', and that is total garbage talk, but we are influenced to believe that sexaling is a 'no no' by subtle means, every day, over the air waves, on tv, in the news, and in the mass media print, in the news papers and news magazines. Well, it is time to burn the 'Inquirer' down, and blow their basement up, as well, as they no doubt, have the same kinds of torture facilities for torturing dualdigers, under them, as well.

Hair Ports

Where else do the viewing ports, or optical ports, and the other ports for sniffing fragrances, and for hearing sounds, and for hearing various coding frequencies, that the organ animals communicate back and forth on, exist?

They grow in nose hair follicles, eye lash follicles, eye brow follicles, nose and throat hair follicles, stomach hair follicles, intestinal skin hair follicles, external skin follicles, head hair follicles, facial hair follicles, leg, arm, and body hair follicles. The sensory ports grow along with the hair follicles, extending their way up the hair shafts, and to the surfaces of the hair follicles so that they can pick up the light waves, and various energies waves, for sounds, and for colors, hues, textures, texturing hues, light and grey, dark and white, prisms, or prismatic colors.

The organ animals transmit in not only sound orientation patterns, but also in light wave frequencies patterns. There are many energies wave forms that they can transmit and pick up, and the multitude of variances and types are far greater then we are aware of. The organ animals can transmit off and send out various frequencies, with various tonal orientations. They can transmit in light wave energies codings of various shades, colors, hues, textures, and patterns. The variety is nearly limitless, and it will take you a long time to study about all of them.

There are odors that they can pick up, and there are odors that they can generate, when they are healthy. They are not healthy, unless you feed them, correctly. If you do not feed them the foods that they like, they will not send out any special energies wave forms, or even odors, or much of any thing else, as they are starving, and have no way of supplying the needed nutrients to the internal organs of the organ animals, for the internal organs to produce the energies needed, to transmit and send signals out in.

If you do not feed the organ animals the foods they need, they become pathetically weak, and they will barely do any thing, at all, in terms of communicating with other organs animals.

If the organ animals do not communicate with other organs animals in our own body, and in other people's bodies, they can not meet and talk with other organs animals, and they can not sing to each other, and they can not give off the scents and odors that signal health and well beingness and that bring cheer and happiness, and vital energies to each other, as they sexually arouse each other, and that in turn, sexually arouse us, as a spin off of their good health, fitness, and well beingness.

They are stuck in a pathetically weak physical condition, all their life, narly starving to death, because of the poor diets we are encouraged to eat, that do not give them the nutrients they need to get healthy, and fit. The pitifully poor in nutrients foods such as corn flakes, or cheerios, raisin bran, total, and so forth, manufactured by Kellog's or Proctor and Gamble, General Mills, Quaker Oats, etc., and all the other, pathetically nutritionless foods that the major and minor dhourties' foods manufacturers produce, that we eat, day in and day out, do nothing for the health and welfare of our organ animals, and these foods barely keep us alive, nutritionally speaking.

The organ animals, when healthy, can use all the possible transmission frequencies that are available to them, to speak to others, and to communicate with others, and to begin to have a good time, in life. They deserve to have a good time, in life, just as your pet dog does, and just as your pet parakeet does, and just as your pet cat or ferret does.

We can not starve these animals inside of our bodies, which is basically what we are doing, at the present. We can not deny them a view to the outside world by covering up our bodies with clothes, women's and girls' faces with veils and women's and girls' hair with scarves as in the middle east, and with face powder and mascara, as is the tradition in the west, and in some eastern countries.

We can not deny the organ animals companionship with others of their species, if you can call it that. They are living beings, and they are creatures. They are breathing, and alive, and they wish to be fed, and they wish to stay healthy, and they wish to meet others, and they wish to be able to communicate with others, and we deny them those rights of theirs, and others of their rights, because we are ignorant as to the fact of their existence in our bodies.

This is obviously a conspiracy, if you haven't figured it out, by now, and we have to put a stop to it. We also have to educate our selves as to how to feed them, and how to properly feed our bodies for maximum nutrient intake to the organ animals, that are the basis for our physical, mental, emotional, and spiritual well beingness.

In time, we will learn more about all of this as we get the cooperation of more and more of the dhourties, who are willing to cooperate, and who are willing to teach you, my dualdiger children, about all of this. I am GOD, and I am your mom and pop. I can call you my children, and I can call my dhourty children, my children, and you had all better get used to it, as now and then I will address all of you as my children, whether people like it or not.

I've got lots of children in my universe, and some of them look like fucking apes, and some of them look like fucking monkeys, and some of them look like ostriches, and you won't believe the mutataions they have gone through, some of them, and actually, lots of them. Many of them are mixed mutations, that they have gone through, and lots of them look nothing like any thing you've ever seen before. They are gruesome looking, and scarisome, and you would not like to meet them, guraranteed, as they will tend to eat you up, if they can. It's the result of their karma, and it will be a long time before we erase eneough of their karma to make a difference, so as to bring them back to a form that is close to or similar to what a human being looks like, for us to then mix with, marry with, and sexal with. You were all the spouses of each other, from way, way, back, and you will be the kids of mine, and you will be marrying each other, again and again, as there is no limit to the number of times you can form a parental union, and that means with more than one spouse in tow. You can form parental unions with more than one spouse, and there is no limit, practically, to the number of spouses you can have, male and female, at the same time.

I'm not sure what the limit is, but it is a working number of people, and that means, any where below a few trillion, or maybe even a few more. You can have nearly an unlimited number of spouses, and that's probably more like it, but the trick is, how do you manage all your spouses, that is, how do you serve and protect, and sexal with all of them, when the number grows over a few million or more. Well, it takes time, and experience to teach you that, and you'll learn all that, in your courses you'll be taking, when you start up studying, and participating in the programs that I and my children have planned for you, once we get a little further into the Gurkian Age. We are still in the preparatory stages, of my religous revolution, and soon we will be getting past the preparatory stages, and how soon, I can't estimate, but obviously, we need the cooperation of the dhourty governments, and of the dhourties to begin to get any where.

Teeth Ports

We have teeth and finger nails, and toe nails that also have optical ports, and other sensory ports in them. Of course our animals inside of our teeth want to make friends with other animals inside of other people's teeth. There are also many other animals inside of us who can use the viewing, or optical ports inside the teeth, and in the finger nails, and in the toe nails, for viewing outside of the body, and for looking at other animals in other people's bodies, and then for

communicating with those animals. All these animals are organ animals, and they are on the job, twenty four hours a day, seven days a week, and they barely ever sleep. They like to make contact with others of thier kind. I don't know if 'species' is correct, but they are all my worker animals, or in this case, worker organ animals. They need respect just like your puppy dogs and your cats and your parrots do, if you are a normal human being who respects other living beings. Well, any way, lots of these organ animals inside of us, are very clever, and much more clever than we are, in some ways. You can study about them and how they communicate with each other, and how they have fun with each other, once we get the educational materials that I handed out, to the FBI, and that was passed on to the governments of the world, as I've explained about, before.

We probably should not cover up our faces with makeup, because that makes it hard for organ animals to see out side into the world around them. It also makes communicating difficult, when we put on face makeup, that is, when women and girls put on face makeup, as that gets in the way of the optical viewing ports, and it gets in the way of the ear ports, the hearing ports, or the incoming signals ports. Also, finger nail polish and toe nail polish is of course, obstructive, and it prevents the organ animals from communicating out and it prevents the organ animals from recieving incomeing light wave and signals waves transmission signals that depend on your having clear and not painted toe and finger nails. Hair coloring in women and in men, and beard coloring in men, is also obstrutive, and it prevents the incoming and out going signals, and is just as bad as nail polish, and makeup, or face veils, such as they wear in the middle east, and scarves over the hair, which women and girls in the middle east are also forced to wear. It's not fair, what is going on. We are being suppressed by our dhourty friends, who do not treat us very well, aren't we. We are being told how to live our lives, and it is all totally fictitious, and made up, it's a fairy tale dream land they have created, with artificial rules, and artificial religious beliefs, and artificial laws that mean nothing, when we look more closely at them, such as the 'lewdness' laws, and the 'incest' laws, and the 'nakedity' laws, and the 'no public sexaling' laws. It's all foolish dribble drabble, or nonsense, they made up, from their not so smart, brains of theirs.

Well, anyway, we'll get it all straightened out, one day, soon, I hope. Until then, let's talk with our friends, and tell them about all of this, and see what wild kinds of parties, you can begin to have with your friends, all naked, and having fun with each other. Invite your dhourty friends, too, because they have a lot to teach you, and if they do not wish to come, then maybe you should ask them why? Usually, they are older, as not many of them can rejuvenate themselves to look much younger than eight or nine years old. Some girls, though, they may be able to rejuvenate them selves to what would appear to be a four year old, if their bones are small enough. In some Asian countries, some girls may look even three and a half years old,

because they are so tiny, some of them, and their bones are very small. The smaller your bones are, the younger you can make your self look, when you rejuvenate your self.

Captain Off The Bridge.

Dick and Cunt Animals, And Other 'Sexaling' Organs Animals

Dick, scrotum, and cunt animals, and boobie animals, and breasts animals, and butty butt animals, butty butt hole animals, groin animals, underarm animals, and every organ animal in your body, they do not like you to wear clothes.

Organ animals like to be able to smell the odors around them in their environments, and that means, the odors on the outside of your body, as well as the odors on the inside of your body. There are noses, or odor sensors on the outside or skin of your body, and on the surfaces of the hair shafts, finger nails, and toe nails, odor sensors that function as noses, as I explained. The tiny organs animals in side of your body, as well as the big organs animals inside of your body, they all have noses attached, or odors sensors that function as noses, to smell the odors, in the atmospheres, around them.

The organs animals inside of your body, as well as your dermal skin organ animals, hair organ animals, teeth organ animals, bone organ animals, sinew organ animals, cartiladges organs animals, ligatures organs animals, and so forth, they all get a better sense of what is around you, if you do not wear clothes. They can smell or sense the odors of other people, and the odors of the organs animals inside of other people, that are in the air on the outside of your body, that drift in the air, from the ladies' bodies organs animals and from the

mens' bodies' organs animals.

Incompatible Fumes Animals

The organs animals of your dick, cunt, groin, breasts, hips, butt, legs, and so forth, all enjoy the odors of other people's organs animals. If you leave your windows open, in the day time, and at night, and bring in the fresh air of the outside with the odors of kids, girls, boys, men, and women, and if you take your pants off, and underpants off, and your shirt or blouse off, and socks or stockings off, as you get healthier from a proper diet for feeding your organs animals, and for feeding you, as well, when your organs animals become healthy, they will perk up right away as they sense or smell, the odors of the kids, girls, boys, women and men, and elderly people, who are in your neighborhood, walking by your home, or by your apartment, daily.

The odors of other organs animals, such as those of dogs, cats, birds, and other animals, are all good for the health of the organs animals inside of your body and they perk up the organs animals to some extent. The best compatiblities of organs animals, such as mens', womens', girls', and boys' organs animals, perk up the organs animals inside of your body, and inside of your dick if you are a male, and inside of your cunt, if you are a female, and all of your sexaling organs animals, the most.

All animals, big and small, all have organs animals with similar shapes, and all the organs animals come in different sizes, and they all give off wonderful odors that stimulate your organs animals appetite for enjoyment, and for fun, and entertainment.

Organs animals get their entertainment communicating with other organs animals, and by exhanging odors and messages of various kinds, and singing and talking, and if they can not smell or sense other organs animals, because you are always wearing clothes, and if they can not see them, or hear them, your organs animals and you will slowly perish, and their interest in living, and your interest in living, will slowly diminish, and they will grow sad, and you will also grow sad.

The poly carbonates plastics and fumes animals' smells, and the over powering, over whelming poisonous fumes animals that mess up the smell sensing of the organs animals, and mess up their brains, bodies, and nervous systems, will cause the organs animals to lead sick, lonely, unhappy, tragic lives, and they will slowly die, as they get eaten up by fumes animals from gasoline, car exhaust, industrial pollution, plastics, nylon carpets, polyester sheets, polyester blankets, nylon and polyester clothing, polyester pillows, nylon stockings, polyester and nylon panties of women, polyester and nylon socks and underware of men, and as they get eaten up by other incompatible fumes animals from the chemicals industry, and from the petro chemical industry, and from the brewery industry.

I've mentioned, before, store bought whiskey, gin, vermouth, and so forth, all have various types of alcohol in them, that are made from different processes, from the petro chemical industry and from the chemicals industry. That poison but drinkable alcohol is blended in with naturally brewed, normal, drinkable whiskey, or other alchol beverage, and then sold to the public to drink. Apple cider vinegar has one type of this poison but drinkable alcohol in it, and wines, beers, and liquors all have poison but drinkable alcohol of different types, in them.

Organs animals do not like to smell or inhale, or sense, the odors of the poly saturates plastics animals and the odors of the plastics animals' relatives from the chemicals industry, and from the petrochemical industry.

Organs animals prefer the odors of cotton, and wool, and of natural fibers from plants, and odors from fibers from animals, and organs animals get sick if they are forced to sense the odors of the poly saturates plastics animals, and other related animals, from the two industries, mentioned above.

If organs animals are forced to inhale, or sense the odors of these plastics animals, and fumes animals, that are incompatible with human beings, they get sick, and they die, eventually, from sensing them over too long a period of time. It is not good for them, and it is not good for their nervous systems, and the fumes are not good for you, either. The plastics and other detrimental fumes animals, find the organs animals, tasty, and they eat them up, little by little.

Your body gets eaten up, little by little, by these incompatible fumes animals, who eat up little and big organs animals, and then poop and pee out all kinds of petroleum related substances, and other harmful chemical substances.

These worsen the health of your organs animals, day by day, hour by hour. One day, your dick or your cunt, will not wake up, any more, as you grow older in age, and it is because your organs animals in your dick, or in your cunt, have been too seriously damaged by all the incompatible fumes and other animals, that eat up your dick organ animals, or your cunt animals, and you loose the sensitivity, and you loose the organs animals that provide juices of various kinds, to provide your body with aphrodesics animals. Your desire for sexaling begins to fall, as you grow older, as a result, and you loose your interest in sexaling.

The butthole organ animals hold out longer than the dick and the cunt organ animals, and the titty nipple animals, lips animals, and other organs animals needed for sexaling with each other.

That means, your dick may be of no or of little use, or your cunt may be of little or of no use, but your butt hole, and your shank, are doing, better, perhaps, depending on your diet. If your diet is filled with foods that are loaded in preservatives, iodized table salt,

petroleum tainted sugar, and or sugar tampered with by the use of many other unhealthful to humans animals, and if you eat a lot of fast foods, or foods made for you, such as precooked meals, you serve from the freezer, for a fast warm up in the micro wave oven, which adds more unhealthy animals to your diet, by the way, your organs animals may not be in very good shape, in your mouth, throat, tummy, shank, and in the butt hole.

Micro wave, by the way, leaves lots of animals of various kinds, on your skin, just like the sun light does. The micro wave animals, get together with other animals that should not be on your body, and which should not be in your body, and they start breeding, and feeding on each other and feeding on your body, and they begin making a nice home of your body, and later in life, your body will erupt in a catastrophic destruction, when all of a sudden, your whole body erupts with countless, incompatible animals, eating up your body organs, inside and out.

Preventing Body Melt Down Tragedy

Molds animals, and funguses animals, and ocean salt, and raw, pure sugar, and other nutrients, will help your body to over power all of these incompatible animals, and the incompatible animals will eventually all get destroyed if you are diligent and make sure that you eat the types of molds animals, and funguses animals that are needed in your body. You can learn more about this, when you get the software package from the government, as I've mentioned about, before, or when you make friends with a dhourty, and learn from him or her, as I've mentioned about, before.

The Dhourties never mention this type of outbreak of animals in peoples' bodies that eat up their bodies, all of a sudden, on the TV or in the news papers, as a person who has an outbreak is too grissely to look at, and the person smells, terrible. It most often occurs in the elderly, and the elderly are hidden from others, and no one in the general public ever sees the elderly when their bodies begin to get eaten up by these animals. It can happen to persons who are not elderly, if the person is exposed to dangerously high levels of toxic fumes animals, and other incompatible animals, on a daily basis.

The person's body, melts, and sours, and becomes greasy, as the organs animals are all being eaten up, all of a sudden. It often starts on the head, as it erupts on the scalp, or on the face, hands, feet, or skin. Lots of these people live in side their homes, and never come out, as they look and smell too awful, as they slowly die. Many times, when a person at home is sick, after an eruption begins, a family member or friend will often times shoot the person, or assist the person with a suicide, as the person is too horrible to look at, as he or she begins to melt, and as the person begins to smell awful.

Often times, if the dhourties get to these people, first, the dhourties transfer these people to the torture rooms, below hospitals,

and below prisons, and below, welfare housing projects, when they find them.

Keeping People Alive To Torture Them

They then use their technical know how, to preserve the decaying person, as he or she is being eaten up, and they extend the life of the person, with their medical sciences know how, and they do peculiar things to these people, and turn them into people who never die.

The brain does not die, easily. We think it does, but it does not die, if you place it in a bottle of formaldehyde, or in a bottle of rubbing alchohol. You can place nutrients for the organs animals to eat, and they are just like fish, with the right combination of nutrients mixed in the solutions. The brains do not die, and they are alive, and that means, the person is alive.

They do not need to breath. We and our four legged animals, and two legged birds animals, need air animals and various gasses animals, that carry in lots of useful substances, that mix in with our blood, and then carry the useful substances around the body, bringing them to the organs animals, for them to absorb through their bodies, through tiny little pores, and openings, that the organs animals can suck in the fluids through. They also expell the fluids, once they have absorbed the useful substances they need to keep them alive.

If you place a solution that has all the needed ingredients into it, and then force it into the lungs, the person will no longer need to breath, air and gasses, animals, and they can live almost indefinetly, though it is a very cruel thing to do to a person.

They do not feel well, and they can no longer talk. They do not like it, and they begin to hurt, all over the body. They will, however, stay alive, and then as they stay alive, the dhourties torture them, futher.

They do this to elderly people, all the time, when elderly people, begin to decay and degenerate into a blob of oily substances, that smell very foul.

Of course, no one is going to tell you about this in a medical journal, as it is a trick or prank, the dhourties use, as they like to torture, dualdigers, if they can get a chance to torture them.

If you walk around with no clohes on, the organs animals in your body, will perk up, and they will begin to feel better. If you feed them properly, with molds from breads, and with the foods the molds animals like to eat, such as beef, ham, fish, foul, eggs, corn, cheese, yogurt, milk, cream, spagetti, linguini, pizza, breads, peanut butter, jams, fruits, vegetables, nuts, and so forth, and then poop and pee out, you will make your organs animals diets, much more healthful to them, and they will return to active duty, for you, and they will begin to work for you, as they are very intelligent, almost like

people, many of them, and some of them are even better, or smarter than people, such as your brains organs animals, and your nerves organs animals, many of them, and lots of other sense organs related organs animals.

The brains and nerves, and other related organ animals, and also, some other organs animals, besides them, make it possible for you to think. If we didn't have them in us, in many different places, throughout our entire body, we wouldn't be able to think, and we wouldn't be able to do any thing, such as walk, talk, shake hands, eat, pee, poop, think, sense things, make love, sexal, and so forth.

Natural Plant Fibers, Fur Fibers, Clothing, And Cloth

We need to be allowed to walk around, and live with no clothes on, when we can. If it is too cold, we need to keep our selves warm, by dresssing in compatible clothes materials, such as cotton, wool, fur skins, and clothes made from various plant fibers such as hemp or jute fibers, coconut husk fibers, cotton fibers, wood pulp fibers, heavy, fiberous leaves fibers, reed fibers, root plants fibers, tuborlongs fibers, and soy bean husks fibers, and barley husks fibers, rice husks fibers, corn husks fibers, and various other plant fibers, that we can plant, grow, harvest, and then mix and match with compatible fibers for making the clothing to keep us warm, or to make the clothing, we like to dress up in, and go out to the movies, or to the theater, or to go shopping, to school, or to work in.

You can also harvest natural fur fibers from chipmunks, squirels, deer, elk, antelope, goats, cows, horses, donkeys, mules, and from bears, ducks, chickens, parrots, swans, flamingos, sea otters, oselots, dogs, wolves, dingos, kangaroos, koala bears, and from other animals. These fibers, once you harvest them, and process them, with patented technologies, the Dhourties, hide and conceal from Dualdigers, can also be used to make cloth, and clothing materials.

The dhourties and others, know about the technologies needed for making natural fibers cloth from leaf fibers, and from wood pulp fibers, and from fur fibers, but the dhourties do not allow people to make these types of natural fibers cloths, as they are too healthful for you to wear and use in your daily life.

Many people need not wear anything, when the climate is mild, and warm. If it is rainy, they need some protection, maybe, from the water falling, to keep their hair dry, and to keep them feeling comfortable. After the rain is over though, the clothes, such as a poncho, or rain jacket, can come off, and your body's organs animals will be able to smell, or sense, the fresh odors after the cool rain shower.

The dhourties do not want you to walk around, naked, as they know that your health will improve. They also know that your animal organs and their health, will improve. When the animals organs health improves, they will be able to become more active, and that will make you more

healthy, the more active, and the more interested in life, and in living, they become.

The dhourties made up the fictious bible stories, and they made up the fictitious islamic, judaic, and christian creation stories, and they made up the evolution stories, as well, and they try to make it seem that the bible is the source for morals, and the bible says that butt fuckaling is wrong, and that sexaling with other persons, other than for making children with your wife is wrong.

People Living Inside Of Our Planet

They then based a whole culture, every culture on this planet, nearly, on fictitious myths, and untrue stories, to keep people from enjoying sexaling, because they say, the dualdigers make too many babies, and if they are not stopped from making babies, they will over run the dhourties, as there are ten times the number of people on this planet, than I originally estimated, which was in the area of nine billion or so, to eleven, thirteen, or fourteen billion. There are ten times that many people on this planet, and there are lots of people living inside the planet, we do not know any thing about.

How Do Volcanoes Work

Volcanoes have a heated mass of easily melted rocks materials, and that pools in a tube, in a 'beaker' like tube, and it swishes around, as the earth turns, and it gets hotter and hotter, and the crumbling mass of rocks, melt down, and they swish around in the bottom of the 'beaker', and every where else, outside the area of the 'beaker' stays warm or cool, and the futher you get away from the 'beaker', the cooler the rocks get. We have people living in the core of this planet, we know nothing about. We have other people, living in other areas of the sub surface areas of this planet, and we do not know any thing about them, either. They all arrrived here, as members of the sexaling for a living outbound expedition new planets settlement programs, from many other planets in our universe.

The dhourties do not like us to make children, and they want to keep us impotent, and they want to keep us separated from each other, and they want us to keep on our clothes, so that our organs animals will not feel good, as they choke on fumes they inhale, or sense, and as they die, from early childhood, on upwards to our old age. We will have less interest in sexaling, as a result of the lower sexaling interests that we have, as we grow up, from fewer and fewer healthy organs animals, and this keeps the population of the dualdigers down, and they think they have a right to do this to us.

They have too many people on this planet, to keep them busy, tortureing, daily, and they do not want any more people on this planet, as they say it is enough to keep them busy, as they work, torturing them. The dualdigers, that's me, and people like me, who can remember their relatively recent birth date, usually people who are

less than one hundred and ten or twenty years old, come and go, and come and go, as tummy babies, and then, as we grow old, we die, and we go back to my Epcot Center, for a short stay, until there is a new tummy mommy and tummy daddies, who help the tummy mommy have a tummy baby, and back to this planet, you or I, or some one, else, comes.

Fictitous Religious Ideas And Fiction Based Social Customs, Taboos, Societal Rules, Legalistic Laws, Codes, Regulations, Prohibitions, Punishments, And Penalties

The dhourties have built our societies around the world, based on their written documents about fictious biblical persons such as 'Moses' and 'Abraham', and 'Jesus', and about the fictitious statements these people supposedly said. These people, 'Moses', Abraham, Jesus, and others, did not do any thing, other than live as dualdiger peasants, in the middle east, the mythlogical land of 'Judea', the land supposedly promised by god, to give to the Jews. They made fictitous statements up, fairy tales, for each religion I orginally taught, and they tore out and threw away, all of the orginal teachings, I had left behind, in all of my teaching my religions, lifetimes, and there were a lot of those life times, and I taught a lot of religions. The other religions, and cults, were made up by the dhourties, as I've talked about, before.

The dhourties made up the ideas, completely, about lewdness, lewd conduct, indecent exposure, indecent conduct, sexually explicit conduct, soliciting sex is bad and wrongful behavior, prostitution is wrongful behavior, prostitues should be punished, sex offender, sex offenders should be punished, child sex offender, child sex offenders should be punished, pandering or pimping, sodomy, i.e., butt fuckaling is wrongful behavior, good girls do not have sex with others before they get married, the need for women and girls to be 'virgins' until marriage, incest or sex between members of the same family is wrongful behavior, persons who enjoy incest, sex between family members, should be punished, public sex is wrongful, public sex acts are wrongful, persons who enjoy public sex should be punished, persons who do not dress properly and who do not conform to public standards, the standards the Dhourties set, should be kept out of restaraunts, bars, pool halls, amusement parks, movie theaters, ice skating rinks, tennis tournaments, hockey games, foot ball games, rugby games, basketball games, baseball games, swimming pools, ponds, rivers, lakes, and off of public beaches, or be put in jails, there is a need for removing the dick foreskin of baby christian and jewish males, there is a need for removing vaginal or cunt tissues from muslim girls, and lots of other taboos and misleading stories, in cultures and in civilizations around the world and around our universe.

Male And Female 'Circumcisions' And Female 'Dick' Removals

The dhourties require all of their members of their organization to rejuvenate their bodies, and when they go out for a 'tour of duty', the dhourties must follow the customs of the society they are joining,

as pretend citizens. Male dhourties who join christian, muslim, and jewish societies, under anesthesia must have their foreskins shaven off their dicks. Female dhourties who join any society, under anesthesia, must have their dicks cut off, amputated, i.e., surgically removed, and then their pelvic region, with cosmetic surgery, must be made to look like the female never had a dick. Female dhourties who join muslim and jewish, and some christian societies must submit to have their vaginal, or cunt tissues, sliced off, by surgical means, under anesthesia, and the cunt tissues that remain must be made to look in appearance the same as all other muslim female's shaved off, or sliced off cunt tissues.

Butt Fuckaling And Sexaling

Butt fuckaling is a very healthy activity for you and for your friends, as the dick animals and the butt hole animals, and the butt hole shank animals all get to smell the odors of other organs animals, in different people's bodies. Sexaling is a very healthy activity, of course, as it allows all the organs animals in your dick, if you are a male, and in your cunt, if you are a female, and all the other sexaling organs animals in your bodies, to smell or sense each other, and to talk, sing, play games, and communicate with each other, in different people's bodies.

The Dhourties want you to be unhealthy, and they do not want you to enjoy sexaling, and they do not want you to enjoy good health.

Water, Chlorine, And Flurine, And Burning Body Syndrome

Tap water has chlorine in it, as I've mentioned before, and it also has flurine, and both of these are powerful chemicals, and you can get easily poisoned by both of them. People who inhale the gasses in tap water, the chlorine fumes animals, and the flurine fumes animals, which are also found in tooth paste, will develop a medical condition called 'burning body' syndrome. You can also develop partial body, burning body syndrome, such as 'burning arms' syndrome, or 'burning legs' syndrome. People who spend a lot of time at the pool side, inhaling fumes from the pool water, may likely develop 'burning body' syndrome. Your body, at the skin and under the skin in the muscles, feels heated up, burning or painful, sometimes almost scorching, and uncomfortable.

Detergents soaps fumes animals, industrial soaps for janitorial uses, also cause burning body syndrome, and asbestos animals also cause burning body syndrome. Fumes animals also cause fibromyalgia, as I've mentioned.

Burning body syndrome and fibromyalgia are often misdiagnosed as 'panic disorder', or 'chronic anxiety disorder', or as 'anxiety disorder', or as some type of severe allergy related disorder, such as what firemen and firewomen often get, when they go to houses and apartments that have caught fire, and try to put out the fire, and the

firemen and fire women, and police officers, and on lookers, inhale all the plastics fumes animals, that come out in the black, peculiar smelling smoke that comes from plastics burning.

You are better off to not breath these fumes, and you should evacuate the area, when a house, apartment, or building catches on fire. It is too hazardous to your health to stay around, and try to put out the fire, or to watch from a distance, as every one will get ill from inhaling the burning plastics' fumes animals that come out with the smoke.

Body Melt Down Prevention And Salted Food Oils

You can salt food oils, such as corn oil, vegetable oil, olive oil, sunflower seed oil, safflower oil, and nut oils, with a little ocean salt, as you pour in a small amount of salt to disolve into food oil, or into a mixture of food oils. You do not need to disolve much ocean salt, just half a cup or so, to every one quart to three or even seven, eight or nine quarts. The more salt, the better, as it will help destroy the incompatible fumes animals, and other incompatible animals, the Dhourties unleash on us, daily, in the products we buy at the super markets, and in the air we breath, daily.

Salted Food Oils, Molds Animals, And Funguses Animals

You can ask a Dhourty friend of yours about what types of molds and funguses animals to use, in making your salted food oils, more healthful to use. Ask him or her to help you make the molded breads with the molds and funguses animals, or get the software I gave to the government, that they are in possession of, and that they refuse to distribute to Dualdigers.

Use some of the salted oil to coat your scalp, and lightly coat your hair as you rub it in with your fingers. Dip your hands and fingers into the salted food oil, and rub the salted food oil into your scalp, face, neck, back, chest, tummy, pelvis, underarms, arms, hands, fingers, legs, feet, toes, groin, dick if you are a male, or cunt if you are a female, and into every pore in your body.

Also, rub the salted food oil into your butt crack and massage the salted food oil into your butt hole. Do your feet and toes, last, as there are many bad animals on the feet and between the toes, and under the toe nails. Make sure you rub or massage sufficient salted food oil into your skin, and wait several hours, if you can, before you wipe excess oil off of your skin, before you go out.

Under Arm Deodarants

You do not need under arm deodorant as it is filled with toxic animals that will destroy your body and eat up your organs animals. Use peanut oil for your underarms, and for your groin, and for your feet, and for your butt hole, and butt crack, if you are worried about unpleasant odors. You can also use any other nicely scented oil with flowers oils

mixed in it, as I've mentioned, previously, how to press flowers for making perfume oils.

Vaginal Douching Agents

Do not use vaginal douching agents, as marketed by Eve Arden, or by any of her Dhourty friends and competitors. All vaginal douching agents contain toxic bad animals, that will destroy your vaginal lining, and they will contribute to body melt down syndrome.

Washing Your Back Side, Your Butt Hole And Butt Crack, After You Poop

Use water you can pour from a flower watering pot, to wash off your butt crack, and wash out your butt hole, and to wash the poopal material off your butt area. Tamp or pat dry the butt crack and butt hole area with some toilet tissue, after you wash the poopal material off of your butt hole, and butt crack.

Bidets, Fountain Pooper Hole Washers

You can also use a bidet, or a toilet that sprays out water, up through a hose, or tube, so as to hit your butt hole, and butt crack area. After washing your back side with a bidet, use toilet paper, to dry off your back side. You can find bidets in Europe, and in the Middle East.

Wash your hands with mild soap, blended with salted and sugared food oils to make the soap less toxic to your skin and body. You only need one soap for all indoor purposes. St. Ives, Swiss Formula, Whipped Silk, and St. Ives, Swiss Formula, Vitamin E, are good body wash soaps, after you mix either one or the other with salted food oils. You can then use either one or the other for the face, hands, hair, and body, and for the bathroom, and for the kitchen, and for all indoor needs for soap.

You can take a shower, once, twice, or three times a week, and use salted food oil, on your scalp, hair, and skin, and that will protect your body from bad animals. You can use peanut oil, for a nice odor, and it makes your skin healthy, and body odors begin to disappear, if you eat a healthful diet of molds animals, and funguses animals, and the foods the molds and funguses animals like to eat.

You need to use a clean, dry or lightly damp towel, to wipe off excess oil from your hair. Let the salted food oil soak into the pores of your skin,

Molds Animals And Weight Control

If you feed your body the molds animals and funguses animals, and related animals, and then if you fill your tummy with food for them to eat, they will eat all the food, and they will grow plumb and fat, and you will stay slim and healthy. Food oils and fatty foods feed the molds animals and their friends, and so does whole milk, yogurt, and dairy cream with raw sugar. Meats and so forth, fruits, nuts and

vegetables are all good for them, and they all love these foods. You can feed them practically anything, that is normal for humans to eat, including pizza, spagetti, linguini, hamburgers, french fries, without the petroleum oils mixed in with the food oils for cooking, of course, and they will all devour every thing you feed your tummy with. As they eat and eat, and drink, and eat, they get fat, and full of food. They then pee out, and barf out, and drool out, and leak out, lots of healthful nutrients, for feeding the organs animals in our bodies. The organs animals do not gain too much weight, unless you really over feed them. They may get plump, a little bit, but they can excercise, regularly, and they will slowly slim down. If you do not have the molds animals and their friends in your tummy, and in your body, when you eat, the food will not get digested by any body, special, and it will get eaten up by some tummy animals, of one kind or of another, that your mommy passed on to you, when you were a tummy baby. That will feed the organs animals, some nutrients, but barely enough to stay alive.

We Shall Over Throw And Destroy The Societies The Dhourties Had The Dualdigers Build For The Dhourties

The Dhourties' nonsense is going to end, as you either make friends with the dhourties, as the Dhourties give up and surrender to you, or as you ask them to go to my Epcot Center, using one or another of my explosives formulas, as the Dhourties are not going to get away with much more of their nonsense, for much longer.

The Dhourties' make believe stories, i.e., the fiction of the bible, the koran, and the new testament, and the fiction based laws, codes, regulations, rules, customs, taboos, and so forth, the Dhourties wrote into law, for all of us to blindly follow and obey, are also going to come to an end, soon, as soon as we, the Dualdigers, over throw and destroy the societies that the Dhourties had you and I, and others, all of us Dualdigers, build for them.

Captain Off The Bridge.

Home Experiments, Keeping Alive A Brain In Tequila And Vodka

If you put a brain in tequila and gin, that is a good tequila and vodka, that is home brewed, and very delicious, and if you change the fluids, every so often, you can put a human's brain inside of a beaker large enough to hold the brain comfortably in the liquid fluids. The brain will live, and the thought processes of the person will continue, for an indefinite period of time. Maybe not forever, but, at least for a few million years, or maybe a little more. I don't know for sure, how long, but the Dhourties will be able to tell you. The organs animals in the brain, can survive with the nourishing fluids of the liquid fluids of good home brewed tequila and vodka.

A cat's brain, or a dog's brain can also live for an indefinite period of time, as well. Hamster brains, guinea pig brains, pig brains, horse brains, and chipmunk brains, will also. Chipmunk brains make funny noises, as the think to them selves. If you put a few electrodes into the brain area behind the ears, in a human being, you can hear the person thinking to himself, if you take the electrodes and connect them, safely, with a wire to a good ground on each electrode wire. That is the only safe ground you can make, and current electrical engineering sciences does not teach that, as the Dhourties want to see all the structures that the Dualdigers make, except for the ones the Dualdigers build for the Dhourities, eventually burn down.

The Dhourities will sneak into a building, at night, and wire the building, correctly, to keep the building the Dualdigers are building for the Dhourties, from burning down.

Each brain electrode wire must be grounded, or the person will not feel well, and the person will eventually begin to feel nauseated, and the person will begin to think he or she is vomiting, and eventually the person will begin to experience sweats, cold chills, shaking, and violent convulsions, that lead to trauma of the brain, and brain death. This brain death is a comatose condition.

Comatose Patients And Comatose Brains

A comatose condition is one's brain has stopped thinking, fully, but the person is still there, and the person will revive, but the person will not feel good, and unless the wiring is corrected, the person will go through the same experiences, again.

The organs animals are of course still alive, and they are not feeling well, either, as they do not like the electrical shocks that occur, occasionally, as the improperly grounded wire, back fires, and sets of a shock wave of energies into the surrounding liquids. Every one, on the outside of the brain, gets a tiny shock, and they do not like the feeling of it, as they were not created by me, to endure such shocks,

periodically, or whatever.

The Dhourities do this to their friends, wire their brains in a bottle or beaker of home brewed, good tasting Tequia and Vodka, when one of their friends is punished for breaking one or more of the rules, the Dhourities expect the members of their organization, to keep.

Using Chipmunks For Scientific Experiments

You can experiment on chipmunks, and wire the electrodes properly, and then ground them, of course, and get a professional electrician, or technician, to do the handy work for wiring the electrodes to a ground. The ground should be a good earth ground, with about eighty five feet of steel pipe, three inches round, gently pressed down straight down into the soft earth. Additional copper and magnesium particals, small chunks of copper and magnesium a few inches in diameter, 3/4's of an inch, to two inches, to three inches, to four, to five inches, each, sprinkled around, at different elevations, a few inches to a few feet away from the pipe, every one to three, to eight to ten to fifteen feet or so, as the pipe is pressed downwards into the earth, will help dissipate the energies currents, that come off from the brain, more efficiently.

The Lipporal Lobes

When you have the electrodes placed properly, in the chipmunks brain, just below and behind his ear cavity, the lipporal lobe, you will hear the chipmunk thinking to himself, or to herself, periodically. The sounds will sound like a high pitched, to low pitched squeaking, or squealing, and it will sound like the animal is talking in a language of clicks, and other peculiar language sounds, that may make you think the chipmunk is possibly from a strange, advanced civilization, from another planet, when in fact, he or she is just a common, dirt oriented, earth chipmunk.

The lipporal lobes of humans, are on either side of the brain, as well, and they are just below the ear cavity, to the behind of the ear cavity.

Experiment on a chipmunk, first, to see if you can get it wired up properly. It is against the law, that is, standard universal law, to experiment on any creature without the permissions of the governing body of trust authorities in charge of managing the day to day welfare of the people who are living in the trust union, or state.

Human, Monkey, Or Animal Brains In Beakers Or Jars Of Formaldehyde In High Schools, And Jr. High Schools, Primary Schools, Colleges, And Medical Labs

If you happen to see in a science lab, a brain in a beaker of formaldehyde, empty and throw away the contents of the beaker, and replace the contents of the beaker, after you have given the organ animals a nice bath, in natural, olive oil soap, with no petroleum

animals, or other similar, destructive bad animals, that are incompatible with human beings.

After bathing the organ animals in luke warm water, around, 98 degrees farenheit, or normal body temperature, with a light rinse off, and a gentle scrub off of any accumulated, dust particles, or dirt, that happened to get into the beaker, by accident, pull the brain organs animals out of the wash bath, and place them in a damp towel. The water ph balance number should be a four or four and a half, or five. Make sure their is no chlorine, flurine, or other animals in the water, such as stricknine, or arsenic, which you will typically find in tap water, in very low concentrations.

Giving the brains animals a good bath, will make them feel a little better, because their pee juices, and poopy juices, vomit, and so forth, have made the formaldehyde bath, a very stinky mess for them, for some time, and many of them will be dead, by now, and rotting.

If you know what kinds of molds animals to place into the new tequila and vodka bath, that will help remove the carcasses of the dead, or deceased organs animals.

The extra room created with the removal of the dead bodies of organs animals, will make it possible for existing, healthy organs animals to produce children, and the population of organs animals, will increase to near normal levels, over time.

The whole time, while the organs animals are busy, the person who is in the beaker, or the brain of the person who is in the beaker, will be languishing, in a state of partial to complete comatosic distress.

Once, after a long period of time, the person recovers, and it may be very long, several thousand, to several millions, of years, or even longer, in some cases, the person will wake up, and with a headache, like one has, when one recovers from a very bad weekend of drinking, the person will be very sluggish, for a long period of time, before the person begins to recover from the stresses placed on his brain activities and functions.

You can always find a cooperating Dhourty, who will let you experiment on him or her, to see if this works, and then, you can have fun, talking back and forth, to him or her, over the intercom system, you set up, with the help and expertise of the cooperating Dhourty, for this experiment. This will take much less time, to get the same results.

Cats And Under Water Breathing

As babies, we are all emersed in fluids in the baby jump sack, or the umbilical birthing sack, and we know how to breath, bringing in fluids, and expiring, or pushing out the fluids, in a rythmical manner, as we grow, every day, till it comes time to make the final leap, out of the baby jump sack, and into our world of air and gasses

animals.

You can take a cat, and put the cat to sleep with a little anesthesia, and then fill up the lungs of the cat, with ocean salt water fluids, or with fresh water fluids. Otters swim around in either one, but they prefer ocean salt water, to fresh water, at least, I think, most of them do, maybe eighty eight, to eight nine percent of them, do.

Otters, of course, do not breath air, under water, but they do breath water, under water. The Dhourties will never let you know this, and they tell you the Whale holds its breath, but that is not true, and they tell you the dolphin holds its breath, or the seal holds its breath, or the penguin holds its breath, or the walrus holds its breath, or the white, Alaskan, or Canadian, Arctic bear holds its breath, but these statements are not true, as they all breath, water.

Place the cat in the ocean salt water, or in the lake fresh water, fluids. After it wakes up, it will pass out, after a while. It may become frantic, before it passes out, and it may be fighting, in an attempt to figure out what is wrong, as it never finds itself underwater, not able to breath air.

After it passes out, it will take several days, but it will wake up, eventually, after up to eight to fifteen weeks, or maybe a few weeks longer, up to eighty eight weeks, to three hundred and forty five weeks, to five hundred or so weeks. At most, it can stay in the water, a number of thousands or maybe, tens of thousands of weeks, and any cooperating Dhourty will tell you the specifics on this.

After awhile, the cat will begin to re-learn, slowly, how to breath in a liquid environment. When it does, it will begin to move and swim around, looking for food to eat.

You can feed it fresh, live tuna, or other fresh, living fish, and it will smell it, at first, and it may not be interested, but if you let the blood of the fish, trickle out, a tiny bit at a time, and if you get the cat to notice the discolored water, the water with the blood drops in it, the cat will maneuver over to investigate, and sniff at the blood drops in the water. After the odors are processed by the cat's brain, it will begin to get hungry, and it will eventually chomp down on the fish in the water, and begin eating the fish.

The cat will love the fish in the water, and you need to keep the tank water environment, clean, and free of fecal matter, and pee fluids, so you need to freshen up the tank water, with fresh water, daily, by exchanging the water with fresh, clean water drawn in by pipes from a lake, or from the ocean. Be certain there is no spillage pipes in the area, for around three hundred miles or so, down to sixty five miles, to as little as thirty eight to fifty miles, as the spillage from sewer exhaust pipes in the lake, or in the ocean, will lead to a premature, early death on the part of the cat.

It is not fun to watch a cat die, so in that case, you should catch the cat, and remove it, and then incinerate it in a morgue type, high temperature, body incinerator.

Humans And Underwater Breathing

If you do the same, with a willing and cooperating Dhourty, and place him or her inside a slightly larger tank, he or she will wake up, eventually, and then begin to relearn how to breath, in a liquid environment.

He or she will not like the fact that you have him or her in a tank of water, and the person will try to escape. To prevent that, place metal bars, on the top of the tank, that are overlaying steel bars, of jail cell grade steel bars, welded together, in a criss cross pattern, and secured to the top of the tank.

Use acquarium grade window panes, and use good steel construction, to make sure the Dhourty will not take a rock from the bottom of the tank, or other hard, or metal object, and break the window on the tank.

The Dhourties, have hidden in their bodies, tiny, sophisticated tracer locater energies signals transmitters, and with their advanced technologies, the Dhourties' friends will track down the missing person, and then locate him or her, and then they will attempt to rescue the participating Dhourty, who you are experimenting in the name of understanding, and for the furthering and deepening of your scientific knowledge, with.

There is no way to avoid this rescue attempt, except to ask the participating Dhourty, before hand, where each one of the tracer locaters, tinier than a BB gun's BB, is hidden inside the body or teeth, or jaw bone, toe bone, or knee cap, etc., of the Dhourty.

You may need to set up a type of commode that is used in the space shuttle, or some similar type of commode, to keep the water as free and clear of loose fecal matter debris.

You can also feed the person, the types of fish, the cat enjoyed, and other raw meats, and foul. Cooking the meat, and using barbecue sauce, ketchup, mild red chili peppers, or other mild chili pepper, salt, pepper, or worstireshire sauce, or a good marinade and basting sauce, will make the barbecued, or steel pan fried meat in tasty oils, or marinated, basted, and grilled meat, tastier for the participating Dhourty. Use high quality steak, or beef, filet mignon grade or better, and then the Dhourty will enjoy the hospitality, even more.

The water in the tank, will suffice for drinking water, unless you wish to pass in a can of beer, or soda. Be sure to reclaim the empty can, as you do not want the participating Dhourty to be able to accumulate them, and then use them to damage or deface the inside of the tank.

After you have finished your experiments, you can allow the Dhourty to exit from the tank, and he or she will know what to do, to force the fluids up and out of his or her lungs. They all train in aquatic sciences, and they all know several, or many techniques to use, to expel the water from their lungs, successfully. The water will eventually drain from their lungs, as it leaks out of the lung sacks, through tiny perforations in the lung sacks tissue linings.

If the person passes out, or fakes passing out, hand cuff the person, with three to eight, hand cuffs, the prison style hand cuffs, with leg cuffs, as well, attached, and make sure the person does not slip a pin, or similar sharp instrument into his or her fingers, as he or she attempts to unlock each handcuff, as he or she fakes his or her supposed, but fake, unconcious state of mind.

After you suction out the water from the person's lungs, force in air, and apply CPR, and keep going, untill the person spits out all the fluids, and regains his or her normal breathing. Be sure the person does not bite your tounge off, as you are applying CPR.

Bogus News Stories On Supposed 'Drowning Victims' In The Dhourty, Managed, Owned, And Operated Media

A person will not drown, or die from submersion in the water, as the Dhourties have led us to believe, with their bogus news reports of persons drowning, in the media.

The person is merely passed out, and the heart need not even be beating. The Dhourties have the know how, and techniques they need, to revive supposed 'drowning' 'victims', and they transfer them to their underground torture rooms, for torturing them, when they pull them out of the water, or when they pull them out of the morgue.

Stroke Patients

Catastrophic stroke is not due to loss of blood to the brain, but it is due to brain wireing, being completely destroyed, so as to impair the person's use of his or her limbs.

Fallacy Of Cell Tissues Bursting When Frozen

We are taught in the media, that when a brain is frozen, such as in the case of the people, who have their head frozen in dry ice, or in cryonics suspension, under sub zero temperatures, that the brain cells, and tissue cells with fluids in them, burst, and there is no technology, or medical knowledge at present that would lead to the possibility for recovery of these burst cells.

The possibility of bringing people back at a later date for surgery, to heal them selves from some illness or, 'incurable' disease, is for the time being, an impossibility. It is often said on CNN, by Chuck Yeager, the TV media anchor person, that there is no known way and there are no technologies at present, to bring a person back from a cryonics suspension state of being frozen at sub zero temperatures.

There is much chatter in the nature oriented programs on TV that we need to study how bears can hybernate, and survive, during icey cold winters, in the Canadian Rocky's.

When brains freeze, the animals organs get cold, and they may get chilly, but the organs animals do not burst, but they do get solid, and they are icy cold, however they are not dead.

When you put roast beef from the super market in your freezer, you merely freeze the organs animals in the roast beef. When they thaw out, in your refrigerator, they are as good as new, except they are very cold, and perhaps a little wuzzy, or brain frazzeled, and their thinking is not too clear. Organs animals like temperatures somewhere in the eighties or nineties, or maybe a little higher, or maybe a little lower, as animals body temperatures vary, if they have lots of fluids to help keep them cool. If they get too dried out, and the fluids dry up, they will not die, but they will continue to live, until the brains begin to disintegrate, and chips of brain materials begin to fall or peel away, if we look at the tissues under powerful microscopes, in laboratories, that we do not have.

When this happens, the organs animals brains are falling apart, and even then, there is not complete and total darkness for them, as they can still see objects with their sensoring equipment that allows them to see things. They can also smell things, with their nose sensoring equipment, even though they are drying out, and not completely, dead, but only partially, living. Their thoughts are lonely, and they do not have much energy for talking or communicating with their friends, but they are alive, and they are mentally active.

When we put a person into the ground. Just because that person has stopped breathing, that does not mean that the person is dead. The person is alive, and the person's brain is fine, and well. It takes many years for that body to dry out, and decompose, sufficiently, to finally end the brain's activities of that person, so that the person, is then able to leave the body, with my children's help, and then go to my Epcot Center.

Shadow Cast Slumber

In the wilderness of Alaska, bears sleep in caves, and they may develop frozen bodies, but they are not dead, and the musculature, or rather, the muscle organ animals, are a little cold, or chilly, but when it warms up, sufficiently, the organs animals begin to chirp to each other, and signal to each other, and they begin to chat, and speak to each other, and play games with each other, and communicate, write songs, and poems, and sing to each other. They are very much alive, and brainally active, even though it may be a little cold for them. When they get too cold, they fall into a light slumber. When they thaw out, they begin to perk up, and they begin to chirp and sing to each other, much like morning birds sing to each other. Their brains are wired for this activity, and they repeat it like clockwork. The bear finally begins to unfreeze itself, as its body temperature

climbs, thanks to the activities of the little organs animals inside of the bodies of the bears.

Human beings are no different from bears, and they will freeze up, too, in cold weather. However, their bodies are the same as bears, and they have organs animals in their bodies, too. These organs animals all begin to thaw out, when it warms up, and they begin to chirp, and sing to each other, like morning birds, just awakening in the twighlight hours of morning, when there is still darkness all around, but the sun is on its way up, and the birds sense it, and know it, and eventually, the sun rises up over the horizon.

Human beings can thaw out, just like bears do, and just like all animals do, and they will wake up, when the organs animals warm up the human being - who was in a deep slumber, a shadow cast slumber - suffiently enough.

Shadow cast slumbers are slumbers where you think, now and then, that you know a little about what is going on, as you wake, momentarily, from a light sleep.

Grave yards are full of persons in shadow cast slumbers. When you use formaldehyde to replace the blood of a person, who supposedly died from some accident, or whatever, the formaldehyde functions better than the blood in the person's body, and it allows the person to continue to live, long past the point in time, he or she would otherwise, dry out, and fall apart, and disintegrate into tiny pieces of sawdust like particles. Even in these saw dust like tiny particles, there is still life activities going on, as the very tiny organs animals are, many of them, still fine and awake, and in a slumbering state, a slow motion type state, or mood.

The brains of these organs animals are not dead. Brains of humans are not dead either, after humans 'die' or 'pass on', as we are led to believe by the Dhourties, who feed us their nonsense like, looney, false trivia, which has nothing to do with science.

This is the state of things, and the Dhourties know it. They have grave yard after grave yard with shadow cast persons sleeping in coffins, every where around the world. The only way to make sure a person passes on, and then goes to visit my Epcot Center, with the help of my kids, for a short stay, until repairs are made, and the person is ready again, to come back out, and then get himself or get herself back into the body of a tummy baby, with the help of my kids.

My kids do all the work, and they have the technologies for making all of this possible. They also have the technologies for making my universe run, smoothly. My kids run this place, and they keep it running, despite all the problems we cause to our friends, neighbors, school teachers, parents, family members, and so on. My brain happens to be in command, but that is a different story. It's my cosmic brain, and it is connected to me, apparently, as it is always interrupting

me, while I am thinking, or sleeping, and causing me grief.

It likes to play jokes on me, and I get hasseled by my kids, who work for me, as my kids, collaborate with me, and they are the mouth piece, so to speak, for my brain. My kids have lots of technologies to use, to get into contact with me. They do this for me, to help me to communicate with my brain, so that I will wake up, and remember, 'Hey, I am GOD', my brain then takes over, and it tells me lots of stuff, with the help of my kids, who are the mouthpiece for my brain. My brain is very big, and my existence, as far as I can figure it, is boundless. So is, my brain, pretty much, so there is nothing to worry about, when it comes to whether or not, we will make it through this apparent crisis, that you have been reading about, from me, lately.

Well, never the less, regardless of how big I happen to be, and how big my brain happens to be, I have every thing under control, and my kids are going to continue to work for me, and do the jobs that I need them to do. I have so many kids, you will not be able to count them, and they listen to me, that is, to my brain. They do not listen to me, John Ayres, so much, as I am brain dead, apparently, as I planned it this way, to wake up, one day, when the timing was right, and when the conditions were right, and then announce to every one, 'Hey. I have a new religion, and it is my final religion, and we are going to practice it, regardless of what these Dhourties think they are doing, and we are going to get our universe, all straightened out, with our working for me, that is for me, John Ayres, and at the same time, for me, John Ayres, GOD. Get it. I am GOD, but I am also, John Ayres. You are going to work for me, but you are working for me, and for me, and what does that mean?

It means, my brain and I am inseparable. I may not look like GOD, I may be weak, skinny, a little fat around the waist, and I may be losing my hair, thanks to the petroleum animals, and thanks to the Dhourties, and thanks to my karma, but I planned it this way, so that we would get a new, fresh start, as I begin to tell people about my new religion, and as people begin to practice my new religion, with one and each other.

In any case, we have a lot of graves to dig up, and we have a lot of bodies to place into morgue and funeral parlor incinerators, for a fast burn. We can also use any kind of fire wood, to burn the bodies of those who are in a state of limited capabilities. People might call them zombies, but that's foolish, as they are just sleeping, and they wake now and then, in a shadow cast slumbering state of mind.

Some of you might be afraid to handle this, as you christians, jews, muslims, buddhists, and others have been brain washed into thinking that there is something scary about graves and grave yards, and buried bodies in the ground. All the TV programming the Lesbianists bombard people with to disinform them, and with all the folk lore nonsense, the Dhourties have cleverly tricked almost all of the Dualdigers into believing the nonsense the Dhourties shovel out that is aimed at

disinforming and confusing the Dualdigers.

We have to dig up our old friends and family members, and then place them in funeral parlor creamtoriums, or morgue creamatoriums, to burn them to ashes, so that they, and all the organs animals who work for me, can get to my Epcot Center for them, if they need to get to one, as some of them are fine, and do not need to check in, but once or twice, or three times, maybe, every few billion or more years. Human beings, some times, are okay, for their next go around, and they just hang out, else where, without going in to my Epcot Center, for the full treatment for over hauling them, and for making them as good as new. Lots of animals, and people, get to just hang out, in places, other than in the Epcot Centers, and when it is time to go to be born as a tummy baby, my kids get them and fix them up, and get them ready for their jumping into a fetal baby body, inside the womb of a woman who has been impregnated in her ovary capsule, with the male sperm bunny, which I've explained about, before.

Where do people and others hang out, by the way? That's the first I've heard about that? I don't know, for sure, but it is some where other than at the Epcot Center. I have a lot of places for people to hang out, and I'm not sure where these people, and these worker animal kids of mine, go, between lives.

I'll have to let you know, some time, when my memories are better. Any way, it is not on this planet, but it is on the tippy tippy toe of my little little nose. That's child's speak, for, they are hiding every where. Well, that being said, I guess we can worry about finding them, later, as they do not seem to be in any immediate danger, and they seem to me to be okay, so far as I can see it. There is no such thing as ghosts, by the way, and the notion of it, is nonsense. There are no 'spirits' either, despite the television programing you see on TV, on cable TV, with the A&E cable TV host, Bill Kurtis, and others like him, always talking about haunted this, and haunted that.

The Dhourties have cleverly goof balled all of us dualdigers, into believing in the bunk, and trash, or nonsense stories they made up to keep us in line, and to keep them in business as the 'masters' of others.

They are all greedy people, and they are also, demented, if they think they can rule others, and get away with the things they do.

We are going to dig up our friends, and family members, and empty out our grave yards of all the bodies of so-called 'deceased persons', which is a word that is for the most part, untrue, unless you happen to see only bones in the coffin.

The dhourties had better let us do this, because we want our former friends and family members, former spouses, and former relatives, etc., to get out of their useless bodies, and back out into the waiting line, for a ticket out to a new birth, as a tummy baby in the

tummy of a tummy mommie.

We can not let our friends and other important people, such as our mom and dad, brothers, sisters, relatives, school teachers, and others, sit or lie in their coffin, in the ground, in a shadow cast slumber state of low brain activity. It must be awful, when you think about it, and I'm sure it is not a nice thing to be kept in a coffin, with worms and maggots, eating up your body, and you not being able to do any thing about your situation.

I see we have found another way the Dhourties are torturing us, or at least, torturing our friends and family members, relatives, and others, who made it to the morgue, or funeral parlor.

It's not a funny situation, but it is a scary one, as no one in the government will cooperate with me, apparently, and no one in the government, no Dhourty, any way, will cooperate with you, either, I suspect.

Well, be that as it may, I think it is time we did our home work, and did a little research, and did some experiments, and after the brainally gifted and talented persons among you figure out how to measure brain activities at very minimal amperages, and when they have gotten their tools for studying sciences, such as better microscopes, better telescopes, better listening devices, better biometrics detection devices for measuring pulse, gasses exchanges, movement of fluids through tiny, narrow cavities, or tubes, or holes, or pipelines, such as through blood vessels, and through the blood vessels of the organ animals, temperatures at spot locations, types of fluids without actually taking, for example, direct blood samples from a person's body, brain ignition points, or the points you need to be able to detect, to measure for brain activities that are very minimal, and that occur, once, only one hundred years, or less, for example, which will indicate if a person, or if an organ animal is alive, and other types of measuring devices for detecting various energies types, amounts of energies, flow rates of energies, energies physical characteristics, and so forth, the Dhourties prevent the Dualdigers from experimenting with, developing, manufacturing, and using, then they, the brainally gifted and talented scientists, lab technicians, home hobbyists, and other person with various talents who excelled in school, can begin to verify whether what I am saying, is true or not.

Bodies, Bodies, Every Where, Our Old Friends, Family Members, Spouses, And Others, Living, Present In My Universe, But, Where?

The Dhourities, that is, the Lesbianists, have been active in my universe, a long time. They have been pulling these tricks on people, from nearly the begining of their activities in my universe, I suspect. If that is the case, how many people do we have, on old bits and pieces of planets, that have met with various collisions with other planets, in tombs, and in air tight coffins made of highly durable and long lasting materials, that are still fine, and in tact.

How many people are there, who are not dead, but are frozen, living, though with very little activity going on, in clumps of dirt, hiding in layers of earth, compacted, and tight, like floating frozen caskets, drifting around in space.

How many corpses, all living people, though not living too well, do we have, that are our old friends, we have long since forgotten. The Dhourties can tell you, I am sure, and so can the computers data bases, the Dhourties have access to. The Dhourties in the sexaling for a living programs, who are still active, which is one hundred percent of them - though some may be not in good standing, and those not in good standing, may no longer have access to computer terminals that they used to use, to find out what the scores are - all have computer access, rights and priveleges. If you can convince one or more of them, to cooperate with you, and find out the data on this, you will get an idea as to how many people there are who have not checked in to my Epcot Center, recently, and who are still present yet, unaccounted for.

You will also get an idea as to where many of my kids are hiding, and they are not on the 'tippy tippy tip toes, of my tiny kids' little little noses'. That means, they are not on the noses of the tiny worker animals of mine, that are too small for scientists and lab technicians to see, given the present level of technologies, in the investigative, and other laboratory sciences.

This is a wake up call for all of you to get busy, so we can over throw these Lesbianists/Dhourties, as soon as possible, so that we can begin life, and living, forever, with a fresh, new start, and with all of our friends, family members, and others, present and accounted for.

Those of you who are gifted in the munitions side of things, may get to work, immediately. Those of you women and girls, who have the brains in your head, that I am telling you that you have, had better begin to convince the men and boys in your lives, that there is a problem, that needs their attention. If they are not willing to assist you, maybe you can find other men and boys, as well as other brainally capable women and girls, who will be willing to assist you.

What Is High Blood Pressure?

High blood pressure results due to a number of reasons, but, one of the reasons is you get poisoned by stricknine, arsenic, cyanide, and other poisons in your food, or beverages.

These poisons can be found in iodized salt, pepper, mayonaise, ketchup, mustard, dijon mustard, processed ham, processed meats, pork sausage, animal meat sausage used in 'Dim Sum' or Chinese style sandwhichs, pot stickers, won ton, hot dogs, wieners, pepperoni, pizza, jellies, jams, candy, cakes, pies, chocolate, peanuts, white sugar, white flour, white rice, white bread, tap water, bottled water, 'mountain spring water', milk, yogurt, cheeses, cottage cheese, preserved fish such as salmon, crackers, breads, pastries, and other

foods.

These poisons can also be found in tiny amounts in preservatives. They can also be found in every food additive or beverage additive that the Lesbianists regulate and require food manufacturers to add to foods, beverages, condiments, and other items that you use in your diet, and for your health.

Medicines contain these poisons, in trace amounts, and so do all items sold in pharmacies, and in drug stores, and in sundry products stores, convenience stores, and so forth.

If you ingest too much of these poisons, accidentally, of course, in your diet, you begin to experience the symptoms of so called 'high blood pressure'.

It is peculiar, or bizarre, that the Lesbianists blame salt as the cause for high blood pressure, when it is they, the Lesbianists, who are poisoning every thing you eat, drink, or take for your diet and health.

These poisons can also be found in your laundry detergent, play ground sand box sand, fertilizers, Ortho Grow, iodine, witch hazel, rubbing alchohol, ethyl propyl alchohol or vinegar, and in all manufactured liqours, wines, beers, and all other Dhourty brewed beverage or licensed for brewering beverages, as well as in their pipe tobaco, chewing tobaco, cigars, and cigarets.

They can also be found in your home improvement products, such as in paint, putty, plaster, wall board, wall paper, ceiling tiles, floor tiles, plastics, synthetic fibers and in even natural fibers that have all been chemically treated, for clothing, bedding, curtains, carpets, couch and sofa cloth materials, naugahide car or auto seat covers, and any thing such as nylon, rayon, polyester, or other petro chemical industry related, or chemical industry related manufactured and produced product.

Every thing you touch, even the steel bars on jail cells, automobile body metals, roofing tiles, house sideing coverings, bricks, cinder blocks, mortar, cement, sand, gravel, wood treatment products, glues, Elmer's glue, pen ink, pencil led, mascara, lip stick, face powder, under arm deodarant, soaps, shampoos, and so forth, every thing you can think of that is a manufactured item, or that is an item the Lesbianists have had any connection with the manufacturing of, they all have these and other poisons in them.

Why do the Lesbianists poison every thing? To make your life miserable. I've also explained before, several reasons for why the Lesbianists act the way they do.

Litter, Bodies, Body Parts, Brains, Brains Parts Scattered Everywhere

Every rock, every sand partical, every grain of earth and dust, on this planet and in my universe, carries these poisons animals along with them. The Lesbianists have been up to their mischief, for so long in my universe, they have spread their poisons animals friends thouroughly throughout every cubic inch of territory in my universe, repeatedly.

I have lots of very tiny animals, and every one of them is feeding on even tinier animals. How small do you think the animals are in the poisons that the Lesbianists use?

If we consider that there are 600 million cosms from our living environment down to the so called, molecular level living environment, as I've explained about, previously, and from there, if you consider the 900 billion cosms, or living environments, down to the very difficult to live in, cosms, that are not very populated, below the 900 billion cosms, there are animals either related to these poisons animals, or cousins of these poisons animals, or descendants of these poisons animals, or incendants of these poisons animals or preceeding family members on the family lineage line, living in each of the total 900 billion, 600 million cosms, and even down below those. Incendents are those who come before us, or before some one else, or before a particular plant, or animal. Lots of your family members, your incendants, are still out in our universe, floating around, drifting around, and they have not yet checked into the Epcot Center, or other facility I use for having people get checked and marked, and then data with regards to their life and actvities is recorded and stored.

Marked means, we check them in, and we make sure every thing is doing well, or kosher, in their lives, and that nothing is out of order, or in any way abnormally out of balance, and so forth, in their lives. It's a karmic markups checking station proceedure, and we check for many other things, as well as karmic markups, such as the body condition, the health condition, the animals organs conditions, and many other miscellaneous things.

In other words, any way you look at it, nearly every living environement that we can find my worker animals in, just about every environment has been tainted with these poisons animals, or other poisons animals released by the Lesbianists. That means, that every thing you touch has poisons in it.

ARE YOU LISTENING TO ME SOLDIER? GOOD!

In any event, there is just about nearly nothing in my universe, that does not have in it, the poisons animals that the Lesbianists have released into my universe. My universe is thouroughly saturated, from one end to the other, and from top to bottom with the trash, garbage, poisons of the Lesbianists.

The present, yet missing and unaccounted for, former friends, lovers, parents, family members, and others, can be found, as well, from one end of my universe, to the other, from one side to the other side,

from front to back, and from top to bottom.

My universe was originally much larger than it is now, as I've mentioned about, before. Some of the areas outside our universe, in the areas beyond the boundaries walls, may not be as densely contaminated and littered with the bodies of the lost and missing, present yet unaccounted for, friends, lovers, family, and so on, as other areas, but much of that area, is littered with the debris and rubble of the antics of the Lesbianists, and as well, by the present, living, yet unaccounted for brains, bodies, or brains and bodies of your old time friends, family members, and others, who have not yet checked in.

Karmic Energies

Every one has karmic energies. Karmic energies tell us the health and mental status, as well as the life status, and many other statuses, about the person whose karmic energies we are in the process of checking.

Our checking stations checks on a persons karmic energies, and each person is given an update, on who that person's karmic energies are.

Each person has his or her own unique pattern of karmic energies. Some people may have similar karmic energies patterns, but they are never identical, and there are dissimilarities every where, as well, even in person's karmic energies patterns that seem relatively similar to some one else's karmic energy patterns.

Why is this important to know about? When we first came out here, into my universe, we were all very holy, pure, and unblemished, and our karmic energies patterns were all pretty much the same. We all shared a wide variety of interests with each other. We slowly, over time, became less and less simllar, as our behavior began to determine a rise in a difference in a karmic pattern that was peculiar, or unique to ourselves, and different from all other persons' karmic patterns.

This leads to incompatibilities between people. It also leads to trouble, and distractions of many kinds. Over time, people begin to become more and more diverse, and they share fewer and fewer interests in common with each other, because of the differences in karmic energies patterns that arise over time.

We presently have such diverse karmic energies patterns, that it is a fictional notion that there is a mister right guy waiting for me, if you are a girl, or a ms. right girl waiting for me, some where, if you are a boy.

Love and romance notions such as these, are fictional, and are not in any way associated or based on principles with regards to the realities of our lives, and to the realities of our associations with others.

There is no perfect family for some one, and there is no perfect home life for some one, or for some group of people. Every one has such diverse karmic energies patterns, it is a wonder there is any one even talking to each other, is another way of looking at it. It may sound a stretch to say that, or as if it is some thing made up, but it is true.

How come we do have friends, if this is true, I have to ask?

There are karmic associations in every one's life, and those karmic associations pull people together to and with each other. Those people can not escape from their karmic associations with each other, and they all go happily down the trail, until some one drops off, or is shoved off, and does not return, or until some one gets pulled away, off into another direction, due to a stronger or heavier karmic association with some one else, or with some other persons.

There fore, what? There fore, you are all stuck together, and glued together, and you are not going to escape from one and another, and where ever we left some one off, at a bus terminal for the missing in action, present yet not accounted for, we will eventually pick up each and every one of our missing passengers, as we recover my universe from its current distress. Current distress means, the present distressing situation. It might also refer to the over whelming misery of every one in my universe, who is together, sharing this karmic distress with each other, despite what it might look like, on the outside of our lives, in our every day lives, family lives, work lives, and so on.

This means, no matter how much you may wish some one else where not around you, and no matter how much you wish that there was a way to eliminate the problem of a pesky person, or a group of pesky persons, there is no possibily of ever, in the near to distant future, relatively distant future, anyway, of ever releasing some one from a karmic association with you, if that karmic association is strong enough.

That means, the people around you, the people that you see from day to day, the people that you see on the city streets living in your neighborhood areas, the people that you see living on your planet, the people that you see in the movies, or on television, or in the temple, or churches, or in the synagogues, or in the wars between countries, no matter who they are, all of them have karmic associations with each other, and no matter how many times you destroy each other, it is only after a very long period of time, that the karmic energies patterns, and the karmic energies bonds, or bondings, and the karmic energies associations, that are a part of the karmic energies bonds, and patterns, as well, will slowly diminish, or change hue, color, form, texture, amperage, wave signatures - which is a high level concept or understanding you can learn about, from some one else, as it is too long to explain, and too difficult to explain about for me - or other characteristics.

People go around killing each other, thinking they will get rid of each other, and they are only fooling them selves. They can no more get rid of some one they are karmically bonded with, than can they get rid of their thumb, elbow, jaw, neck, and so on. You can not be born with out all the basic requirements, generally speaking, unless your karmic energies patterns determines that your form be such.

These Lesbianists get a kick out of tearing people apart, piece by piece, and they get a kick out of torturing people. They generally dislike every one, including people in their own organization. That is normal, given the fact that every one is so dissimilar in karmic energies patterns, and in karmic energies this's and that's, i.e., karmic energies tings and dings. They dislike every one in their organization, and they even dislike themselves, as they know they are really messed up, karmically, and they are not happy with how they feel.

When you are not happy with how you feel, you go around blaming other people for your problems, often, and you are unable to see it is not in other people, so much, in some instances, but it is in you, your self, that there is a problem, and you sense that problem, but in your brain, you are not ready to recognize that problem, for one reason or for another.

Anyway, we can say, we all hate each other, and we all hate ourselves, as well, and that is not a lie, and that is not fiction, but that is fact, and that is something that you are all going to have to learn about, and accept, as you begin to prepare your selves, for working in my universe, for ever, with each other.

Do you understand this? I wonder. Not many people will want to believe this is true, but it is true, and until you understand that it is true, you will not want to believe it is true. If you do not want to understand or believe that it is true, than you will simply not understand or believe that it is true.

It is very simple, isn't it. In any case, you are stuck with each other, and until we force these Lesbianists to give up their game, we have a hard war to finish, until we have defeated them, entirely.

That means, it is alright to kill and destroy as many of the Lesbianists as you like, and it is okay to toruture, or threaten with torture, as many of them as you like.

DO YOU UNDERSTAND THIS, SOLDIER? I HOPE SO, BECAUSE I AM NOT GOING TO REPEAT MYSELF!

We are in a war with these Lesbianists, the Dhourities, and until every last one of them is either killed and sent to my Epcot Center or to one of my checking stations, or until they give up, and surrender, and apply to repleat, there will be no cessation in hostilities, by me, against them, and if you are on my side, there will be no cessation of hostilities, by you, either, unless you are just simply tired of fighting them, and you need a break.

Those of you who do not wish to fight, had better move out of the way, as you will, or might, become a casualty of war.

IS THAT UNDERSTOOD, MATE? I HOPE SO, AS I AM NOT GOING TO REPEAT MYSELF!

A War Deaf Hero

A mate is a war deaf hero. A war deaf hero is a coward, and a non combatant. War deaf heros, are chickens, and they only go around acting tough, and speaking tough, and when it comes to getting their asses burned, in a pinch, they are going to go, buck, buck, buck, buck, I don't know why I am doing this. I do not want to do this. I want out of this. Let me out of this. Please let me out of this, and they begin to pee in their pants, and then run and hide.

Do you see what I am saying. I suspect some of you do. This is going to be a serious confrontation, and a lot of people are going to die.

Now, if you are not man enough, or not woman enough to handle this, than go and run for the mountains, as we do not want to find your body among the walking wounded, or partially missing in action, or among the lists of missing in action.

Do you see what I am saying? I think there are a lot of people who are not happy with the present circumstances, and until we find a way to resolve this, you are not going to interfere with my plans, as I am GOD, and I am not going to let you interefere.

That means, it is okay to kill you, and it is okay to leave your sorry ass in the bushes, amoung the wounded, and soon to be dead.

HAVE YOU GOT IT YET? I HOPE YOU DO, MATE, BECAUSE I AM NOT GOING TO REPEAT MYASELF FOR YOU, AGAIN. YOU ARE GOING TO DIE, IF YOU DO NOT WISH TO PARTICIPATE, IS ANOTHER WAY OF SAYING IT, AS WE WILL NOT GIVE A SHIT IF YOU ARE WARNED IN ADVANCE OR NOT OF A COMING ATTACK ON AN ENEMY POSITION.

That means, if you get your ass blown to shit, than that is your problem, not mine, and not any body elses.

You are all my kids, and you are all stuck and glued together with each other, and you can not get rid of each other, permanently, for a very long time, so in the mean time, if you happen to experience a failure, such as your body and limbs are shattered to pieces in a very large explosion, than that is just too bad, isn't it.

Well, I hope you will understand the reality of the situation, by now, and if you do not, then there is no hope for you, and we will be seeing you after we are finished blowing and exploding the shit out of the Lesbianists' defensive positions.

I do not have to make my self clear on that one, as I have listed many of them, repeatedly. Now if you are willing to fight, you will see your loved ones, again, no matter what happens, and that is a certain

fact. There may be persons, who have lost a friend, or a family member, already, but the worst of this is yet to come, as we are far from reaching an agreeement with the Lesbianists for a one two three strike, you're it, annoucement. That means, a one, two, three, and if you do not answer me with a "Yes! I will surrender!", than that is it, and you will have your brains blown out of your head, into fifty million pieces. In other words, until the Lesbianists give up, and surrender, every single one of them, than this war will continue, until the last Lesbianist to surrender or die, is accounted for.

Huuuup Toooittt!

That means, get your action loaded, and get out of your bunks, and beds, and get out of your trousers, and get yourselves moving, sexaling with each other.

What is an action? It is your dick or vagina. To load an action, means to get your dicks up, and get your vaginas up, and ready for combat, or sexaling with each other.

That is an order to my combat troops who are preparing with their men, women, girls, and boys, who are all fighting in this war with us.

That's a strange order, isn't it.

No, not really, as I've already told you how we are going to win this war.

Now. We have a game plan, a war plan, as I've already related to you, on the bulletin board, where you can read my notes. Please follow it, and when you are ready, please take action.

Now, get to your posts, and get ready for war. It is going to be a long one, and it will take us a while to wipe out the enemy. They are every where in my universe, nearly, and we have a lot of people to kill, and account for. Unless they surrender, they face execution, either by me, or by one of my soldiers.

When I say by me, I mean, I will some how manage to get that person killed or put out of commision, and out of the way, due to infirmry, such as a broken body, broken head, tortured body, or tortured, brain. It does not matter how we kill them and how we get them to surrender. We will get them to surrender, all of them, eventually.

CARRY ON!

That means, to my soldiers in the field, or in their tents listening to me, my soldiers know that we mean business, and they know we are not finished with this campaign to get the Lesbianists to halt their activities, immediately, and it is now time to continue with your planning and strategies activities, and events.

DISMISSED!

Captain Off The Bridge.

Experimenting On Dhourties Updated: 09-09-07 Rev.x 20:00 PDT

If you can find a Dhourty, you can make a nice living arrangement for the person. Then, over a period of three to eight weeks, or so, feed the person, him or her, a bottle of home brewed rum, or home brewed tequila, or whatever your favorite home brew is, and it should be mildly strong, and not lukid, or weak and diluted for a child, for instance. It should be mildly strong, and that means, at or above the normal proof for what you find in a typical Savon's Drug Store, or Alchohol And Beverages Control Shop, where the government has people selling booze under the governments watchful 'eyes', an ABC store, as they were known, in Virginia.

Home brew should not have any of the poisons brews, the varieties of brew the Lesbianists make, that are made from ferment methods that involve using petrochemicals, such as for making rubbing alchohol, witch hazel, and ethylpropyl alchohol, which you may find mixed in with vinegar, from time to time. You do not want to use any thing with these types of alchohol in them, and so make your home brew with normal vinegar, which is made from soury fruits, and ocean salt, a little raw sugar, with something to ferment in it, such as berries, or leaves or flowers from an interesting plant, or other such similar things, as I've explained, before.

After several months, you should have some thing that is useful, and I've written a little bit about this, before.

Banana pulp, fresh chili peppers, oranges, potatoes, purple potatoes if you can find them, all spice berries a small amount, and sugar, salt, water, soury vinegar will make a nice and powerful brew, and be careful with it, as it can be very powerful. It can go nearly off the scale for 'proofs', but do not worry, as there are lots of animals in it, that survive, and so if you are careful you will survive too, though you may feel a little woozy, now and then, if you drink too much, at once. It's very good for cleaning out the tummy, and the body, and other organs in the body of some types of nasty animals, and the organs animals they love it.

With several nicely fermented brews, force feed the Dhourty, about a cup an hour, if you can, or build up to it, and then continue to force feed the person, for several weeks, about eight and a half weeks, should be enough time. You can tell if you have fed the person enough brew, in addition to light snacks, now and then, for normal nutritional needs, when the person's pee begins to smell of the brew that you are feeding the person. The person will begin to leak fluids

out of his 'pores', or the openings and ports that the organ animals exhale through, pee through, poop through, and inhale through, etc.

When the person begins to smell of the brew, also on the surfaces of his or her skin, and it should be very clearly distinct, and any body with a nose, should be able to detect it, the odors of brew on the surface of the person's skin, and in the person's naval, and in the person's, butt hole, and in the person's pee hole, and if the person is a woman, in the person's vagina, and in the person's lactate juices.

When the person has sufficiently swallowed brew for several weeks, and when the person smells overly filled with brew, even after taking a nice shower, the odoor should be almost immediately apparent on the surfaces of the person's body, then the person is ready for a test trial.

You can take the person, and saw the person in half, and the top half will continue to be connected to the bottom half.

A person's leg can be sawed off, as carefully as possible to keep nerve animals from being ripped apart, and to keep other animals from being ripped apart, and so you want to do it, surgically, and be as careful as possible.

When you have the leg sawed off, then tickle the foot, or toes, and the person will feel you tickling him or her.

The connections stay connected, despite the fact that you have sawed off the limb. This gives us the possibility for many interesting experiments.

You can grind up the person's leg, in a meat grinder, and keep all the ground up materials in a beaker of brew. Next, tickle the foot, or toes, and the person will still feel you tickling him or her, and the person will begin to laugh, after the person recovers from the pains of having his or her leg ground up in a meat grinder.

So, if you use your imagination, you can come up with all kinds of experiments to have hours of fun and enjoyment with, while learning how these things work.

Some times, an organ animal, may die in the process, and the connection might be lost, to some extent. However, if you keep the leg wrapped in a cotton towel, and pour brew with molds nutrients of one type or another, in with the brew, with salt, and extra sugar, and a little cream, you can feed the organs animals, and they will happily reproduce for you, a replacement organ animal, for the one, or ones that were accidentally lost, i.e., the one's who accidentally died, and then went on to their next job assignment.

This experiment may be practiced on parrots, dogs, cats, lizzards, canaries, and so forth, until you have gotten the hang of it. Once

you've gotten the hang of it, then use your imagination, and see if you can't get a dhourty to become friends with you, and give up his or her affiliation with the Lesbianists, and then, come on over to your side, to cooperate with you. If you experiment on enough Dhourties, you will eventually find some people, who will wish to sign a statement denouncing their organization, renouncing their codes books rules and regulations, etc., and terminating their affiliation with their organization. Once they swear to terminate their affiliation, and once they swear to leave their organization, and then swear to assist you and all other Dualdigers, normal people who can remember their birthday, within the last one hundred and thirty or so years, at max, generally, then you should be started towards having a good relationship, with a few former Dhourties, now that they have changed sides, and joined our side, the Dualdigers' side. I explained a little about how we got the name dualdigers, but there are other meanings to it, as well, and you can ask your dhourty friends for a fuller explanation.

Once you have some 'former dhourties' on your team, you can ask them for a better explanation, and better proceedural methods, for experimenting and for having lots of fun.

Invite your 'dualdiger' neighbors, and your 'former dhourty' friends, in for the experiments, and see if you can't all have a good time, having lots of fun, exeprimenting on your new 'dhourty' guests, all the time, and see if your 'former dhourty' friends know some other interesting experiments they can teach you, that will widen your and your friends understanding of how things actually work with regards to the human body, and brains, etc.

Organ Animals Updated: 29-09-07 Rev.x 18:38 PDT

When you develop your body's health, and start to bring back your body to an online status, with all the organ animals being fed regularly inside of your body, with the foods you select that are good for them, and that will nurture them, as well as you, as I've explained about, a little, on my bulletin board, you will begin to feel some or another of them pumping, a little here, or a little there, or a little over here, and so forth.

You might feel them in your feet, or in the arch of your foot, or in the side of your leg, or in the side of your body, and in the side of your chest, as you lie down, on your side, or in your bun bun, that is your butty butt, or in your tummy, and so forth. You might sit quietly, after a few months of feeding them, and see if they are moving or not.

If you concentrate, on a specific part of your body, that you feel may be moving, or seeming to move, it may start to pulse, stronglier and stronglier, a little at a time.

This is your organ animals excercising methods. They will pulse, and pulse, and pump and pump, and this is how they get their excercise. They are in fact, orgasming.

It sounds funny, but it is true. Your heart pulses, and that is, it orgasms, constantly, or at a constant rate, more or less, even though it picks up when we excercise, harder, and run, and jog, and so forth. So will all these organ animals, one by one, as they come on line, and get into business, they will all begin to pump, or orgasm, living in your body, as you feed them the foods they like to eat.

It sounds very peculiar to most people, perhaps, that we have a body that has animals living inside of it, pumping, and orgasming.

Well, after a while you will get used to it, that you have organ animals inside of you, and in time, maybe few years, to more than a few decades, or so, you will slowly accept the fact that they are in side of your body, and that they are feeling good, and that they are pulsing, and that they are living inside of you.

So long as you feed them the foods that they like to eat, the molds from breads, and from milk you mold up at room temperature with some of your nicer and more useful molds, and from yogurted milk, and from your own cream cheese with new molds to help the cream cheese that you buy in the store and remold up at room temperature in your home, and from cottage cheeses made from scrap or from a container of cottage cheese from the store, that you strain the curds of the creamy but useless and poisoned liquids out, and after you have strained them in water, put them in milk and add some heavy whipping cream and with a number of good, useful molds, you make your self some nicer cottage cheese than they will sell to you in the store, and add some ocean salt and raw sugar to the milks, and bananas are good too, as they help kill the stricknine animals, and the arsenic animals, and the cyanide animals in the milk, make up molded cheeses and feed them to your organs animals, and feed them the brews that you make, with expert help of course, and eventually, you'll get lots of animals all well fed inside of your body.

If you do not know how to do this, without getting your self ill, you may suddenly stop breathing, and you may end up in a morgue, to find your self tagged as 'deceased', and then you might get up to find them waiting there, in the lunch room, with a knife, ready to kill you, before you can escape the morgue, to tell the news papers - a foolish idea - that you came back to life after dying, and you found your self in the morgue, tagged as 'deceased'.

Well, any way, funny things will happen, but do not kill your self by eating the molds that you are not supposed to eat, and that are not suitable for eating, such as stricknine loaded molds, and cyanide and arsenic loaded molds, and other such molds that will also put you in a state of slumber, with out your heart beating, and without your brain very active.

Your animals inside of you, will come to your rescue, because they do not die, even if you stop breathing and pass out.

They will generate enough gasses to awaken your silly self, if you ate some thing that is not good for you, after they clear it from your body, and then rescue you. They all have hearts, and just because your heart stopped, and just because your brain activity went very low, their's did not. They are alive and well, and you will be rescued, if you are waiting, undisturbed, long enough.

It is not a good idea to experiment on your self, and so use a dhourty friend, you've captured, and are in the process of training to be a sexaling slave, or use a pig, police officer, fire department worker who is a dhourty as not all are, but most are, morgue worker, hospital mortician, city mayor, congress men, congress woman, vice president, president, parliamentary member, prime minister, or other animal.

I am looking for a Radio Industries Loudenboomer Mark II schematic and manual. Would some one have a source for this documentation? I have the amp several 4-300Z tubes but no power supply.

I would love to get this vintage boat anchor back on the air.

Thanks,
Paul P.

Is this chassis the same as the Hallicrafters HT-45 that I found on BAMA?
http://bama.edebris.com/manuals/hallicra/ht45iia/ Is the relay in the
power supply or on the amp chassis?
If so any ideas about a convenient power supply?

Source record: 6805

Hi Paul:

The Loudenboomer was acquired by Hallicrafters, so the HT-45 and the Loudenboomer should be very close to the same.

I do not have the manual, but the power supply should be conventional. Probably about 2,500 volts for the plate supply. The filament supply generally is on the amplifier chassis - to eliminate voltage drop on the high current filament cables. Only other thing would be the bias, and that is often supplied by diodes in the cathode - or zero bias.

In short, you can copy almost any high voltage power su0ply for a similar tube final. There are a few high voltage transformers with high current that are only 120 volts. High power guys avoid them like the plague and you can get them often for hauling them away. It will suck power out of a 120 volt receptacle like a 1500 watt heater, and if lights do not dim when that happens, you should be ok.

The Loudenboomer was a pretty amp - although i recall it does not have tuned input. You may want to build insert a tuned input if you are using a solid state driver.

Thanks, folks, for your discussion and links. I'll first try the
matched tubes listed at Antique Electrical Supply or RF Parts--that
would save me a lot of work and some expense. Of course, with these old
rigs, expense is not the prime consideration...

2758. Dial backlash

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-10-01 16:36:25 UTC
From: ricknj10@hotmail.com
Message-ID: <4701207e.256750@news.optonline.net>
Source record: 6810

My Drake 2B has a case of what I think is called backlash. If I move the dial ever so slightly and let go of it the knob tries to return to its original position. The vfo frequency does not seem to change very much, not as much as the knob does. In other words I can tune in a SSB station without much difficulty, but if I atttempt to make tiny changes (to really fine tune the station perfectly) it is almost impossible.
I don't see what causes this. I thought maybe it was due to sticking in the vfo capacitor so I went in there and cleaned the bearings of it - no help. I also cleaned the rail that the dial pointer rides on - no help either. My thinking is that this is due to friction somewhere but I can't seem to see where it might be dragging. Any ideas as to what causes this? Thanks

Source record: 6812

FS Alliance Tenna-Rotor Model U-100 is a light duty rotator and handles small to medium size VHF/UHF ham antennas and TV antennas. This rotator and control console look to be in good condition, but do not work. The control box does not activate the rotor. They look like they have been used very little, so probably an easy fix. Price is $25 plus shipping from 79602.
Thanks, Charlie Hugg,
K5MBX

Rick,

I am not familiar with the 2B however I have found dial cords tend to elasticize with age, stretching instead of driving the pulley assembly. If the 2B uses a pulley/dial string arrangement you may fix the problem by simply replacing the dial cord. I've experienced the same backlash effect but it was remedied with fresh string.

I am almost embarrassed to suggest my other "fix" for the problem. Make sure the skirt for your dial knob isn't rubbing the front panel. I'm sure you've already done that and forgive me for suggesting otherwise. :)

Good luck.

If it's a dial cord problem (and by your description, it probably is),
go to:
http://bama.edebris.com/manuals/drake/2b/ This is a full receiver manual.
There's a page showing how to string the dial pointer and spindle cords.
To read the file, you'll have to download LizardTech's DejaVU program,
which is available at the site.

I was one of the many who owned a 2B and always regretted getting rid of
it...

Hi,

I had a similar problem with my Drake 2B, and figured it was due to dial
cord slippage.
I rubbed a stick of GC Electronics "Dial Cord Dressing",
part number 1212, on the dial cord, and the problem disappeared.

The product is like a sticky wax candle or crayon. I don't know
if they still manufacture it.

It might work. I remember reading a tip (I think in Pop Electronics
'way back) to use the rosin flux residue from rosin core solder.

At Sony we used beeswax which is what the GC dressing is. Your wife may
have some in her sewing basket, or you can get it anywhere where they
sell thread.

The "0" call district was created at the request of ARRL. Perhaps a
note to them could provide the information.

Rude of me not to tell you folks what the problem was. The actual problem turned out to be a broken connection from the bifilar wound RF output transformer.

What is the lowdown on this receiver's performance? I've
read that the parts (display, etc.) are unobtanium, and that
TenTec doesn't support the product. But, how does a good
example perform? Are they well engineered, or something
similar to the low cost Drake entry level receivers of yore..

The pick up broadcast and short wave stations. They work better than the S-38. Ten Tec made them to meet a bid price. They were not proud of them.

I would not sell your R-390A to buy one. They are something you would expect from Radio Shack.

If you do not buy it, you will not regret it.

I don't quite agree with the above.

I find that their selectivity is good, their stability is excellent
(with ovens for the internal oscillators) and the sensitivity is good.

They do fall down a bit in terms of image rejection and IMD products
on the higher frequencies.

Show me the Radio Shack product that had excellent synthesis,
selectable filters, memories and ovens for the crystal oscillators?

I currently have one and what I'd compare it with, in my experience,
is to an UPGRADED Yaesu FRG-7. I'd added tighter ceramic filters to
the FRG-7 but the Ten-Ten SP-325 was still better and of course had
digital readout that the FRG-7 didn't have.

The comment that the vacuum florescent display and driver chip are not
available is true. I recently picked up a recent driver chip as a
spare. However, its firmware must have changed and it lit the display
in a wrong sequence, thus I'm still stumped in terms of a substitute.

While the audio output was designed for line level 600 ohm operation,
simply bypassing the 8 ohm to 600 ohm internal transformer solves that
and gives one a watt or two of audio output for speaker operation.
The previous owner of my SP-325 had gone to the unnecessary trouble of
installing a T-Kit audio amp PCB to get speaker level output. I
removed that useless amp and did the above transformer bypass in my
unit.

Now, the fact that Radio-Mart is selling it is another topic...

I may have overstated the "ordinaryness" of the SP-325, although I did have a Radio Shack receiver that was about the same as the FRG-7 and SP-325.

There are plenty of other receivers I would rather have as a communications receiver, though, and it is not the equal of a Drake RX-340.

In fact, the RX-320D is a much better receiver and is available brand new for $359.

But, that is only my opinion. Maybe I am a bit prejudiced because Radio-Mart is selling it.

I have a homebuilt regen receiver that I love to use for short wave listening.

I agree with both your posts, for the most part. A friend of mine got
one very cheap at a garage sale of all places, and even for $200, it was
pretty poor. With my sloper, there was a lot of intermod, and it was
noisy, to put it mildly. It looked like it had just come out of the box,
and my friend sold it at a hamfest for $250 about a month later.

My $200 Yaesu FRG-7700 was light years better, even with the tobacco
orange stained cabinet and stink it had..

2787. Circuit diagrams of Sputnik radio transmitters around anywhere?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-10-05 20:24:38 UTC
From: Robert Casey <wa2ise@ix.netcom.com>
Message-ID: <470681d7$0$15260$88260bb3@unlimited.teranews.com>
Source record: 6839

It's 50 years Sputnik 1 was launched. And pretty much all it had was a few transmitters keying on and off carriers at 20.005 and 40.002MHz (when on was off the other was on) and the rate of keying was related to the internal air pressure inside the transmitter housing (they use convective cooling). I would imagine that they used a few vacuum tubes, probably filament "pencil" tubes, as transistors were not enough advanced to run at these frequencioes. I've seen pictures of the physical hardware boxes, but are there any diagrams of the circuits used on the web?

I suppose a satellite is the inverse of a boatanchor. :-)

2788. Wabash Deluxe 1158 by Wexler amp ?

I just got it out of storage from about 8 years ago, it's a Wabash
Deluxe Model 1158 amp in a tweed case made by David Wexler & Co.,
Chicago with an Electrovoice Wolverine LS-15, 15 inch speaker. It has
two chassis, and upper and lower.
The lower has a 5Y3, 2 6L6GB, 6SN7, 12AX7, and 6JS7.
The upper has 2 12AX7 and several inputs and controls.
Left side is a jack for Tremolo and 2 pots for Speed and Strength. Next
is 3 jacks for Guitar or other instruments along with a Bass, Volume and
Treble control. Then to the right there are two identical areas each
labeled Microphone or Accordion along with respective Volume and Tone
controls. After I got it, I could find nothing Googling, same result
today, must be a rare item.
I need to get the dust and crap out of it and bring it up slowly with a
Variac.
If anyone has any info like a schematic I'd sure like to know.
tnx
Hank WD5JFR

I have just sent Thomson a certified letter requesting clarification
of the status of this title. It's extremely doubtful, but possible,
they may issue C&D to the servers offering it. If you want it,
on .pdf, DOWNLOAD IT NOW.

If they do, they won't bother anyone who has it if they don't
publicly distribute it. Copyright is challengeable if it exists at
all because it's been out for years and they did nothing.

What in the world are you babbling about?

OH! RADIO DATA HANDBOOK///

Do you figure Thomsen owns it because they bought some portion of RCA
Corporation?

If so WHO owns that part of Thomsen now?

Aren't copyrights for written materials from the early days 75 years
or something?

Are you going to make me search fro stuff I'm not gonna find a lot
about?

Tune in next time to As the Transformer Burns and find out!

I need to replace some capacitors in a boat anchor receiver. These caps are across the power supply rails on a logic circuit board. They are marked "227 +10K". My interpretation of that is 220 MF. at 10 VDC with a 10% tolerance. Does my interpretation sound correct?

Any suggestions for a replacement? If I use tantalums will I be doing this again in 20 years?

Thanks,
--

Sorry, Radiotron Designer's Handbook, Fourth Edition.

In reality it's almost certainly public domain-almost certainly as in
almost certainly they really went to the moon or almost certainly
Marilyn Monroe met with some foul play. But a nut named Andrew McCoy,
alias Andre Jute, has wrecked our group with pissing about how it
really is not public domain, so I have had to "settle the matter".

If you don't have the .pdf, you might want to download it now.

> But you will know you're a thief, won't you?

One can only steal what can be stolen, and only what is owned can be stolen. No one owns RDH 4. Not Newnes, not Audio Amateur Productions, not Thunderfunk Amps, not Thomson, and very certainly not Andrew McCoy d/b/a Andre Jute.

If any one did own it they would have issued a C&D by now. They have not because they do not. They will not because they can not. At the very least they would have allowed free distribution only with attribution, which they have not asked for.

You are a liar, a thief, a mountebank, and probably a mattoid, Andrew.

2796. FS: RME-69, matching speaker & converter

I have for sale an RME-69 receiver with the matching speaker and the
matching converter (5 and 10m). The receiver is fine working order.
I've never powered up the converter.

The price is $450 + shipping from zip code 26033.

Drop me a line for further details.

You are quite a character! You claim the book is owned by Newnes yet you claim it was stolen from YOU. Your "facts" just do not add up.

If it was indeed copyright the owner would have removed it by now (if they even cared).

Very precisely.

Companies like Newnes guard their property very well. They have full time infringement monitoring and attorneys on retainer in every country in the world worth bothering with. Anyone doubting that need only put up a scanned book that IS copyright and they will find out.

The book is a work for hire from a company that no longer exists in any tangible form. Like most of the classic RCA and GE tube manuals and educational materials published before about 1962-64 the copyright was not renewed at the time and because of US law and laws elsewhere is effectively out of copyright. Andre's opinions not withstanding are irrelevant.

The fact that the book was reprinted is irrelevant. In fact, I suspect Newnes never would have bothered reprinting it if it were subject to copyright. It is very difficult for third parties to license old books in most cases because tracking down everyone is a hassle and because most publishing houses in New York refuse to talk to anyone without a lot of money-they just can't be bothered.

Andre(w) is a liar, a mountebank, and a shithead. It's likely he molests koala bears and craps in his neighbors' hydrangea bushes as well, but this as yet unproven.

So, he camps with Arny. It also explains the state
of Arny's bushes. And they are brown bears, not Koalas.

2802. Pre-Ebay Auction Offering

Hi guys!

Part of my boatanchor collection, too many radios now and too little space. All collector quality and working! Serious collector Dx-er and shortwave enthusiast, now I've decided to slim down to just my Hammarlunds, would love to get my hands on a collector-quality HQ-180!!!

So here goes what I've got before I put them up on Ebay!

National NC-183D with matching speaker.
National NC-173
National NC-88
Hallicrafters S-53A

All are working, some have SAMS and all have been checked out / tweaked by a life long Ham & electrical engineer...

email me for questions, pics, interest, and thanks for taking you time to look. If you love the warm glow of vacuum tubes, the whistle of tuning in shortwave at night you might give one of these guys a good home!

P.S. Location, Grand Canyon State

This is the same old story twice: "We stole it so often, it is now
ours."

Then the thief Bret Ludwig, who has never seen the inside of a
publisher and never will, sets himself up as an "expert" on publishing
house practice, starting with a paranoid daydream absolutely typical
of his fascist mentality:

> Companies like Newnes guard their property very well. They have full
> time infringement monitoring and attorneys on retainer in every
> country in the world worth bothering with. Anyone doubting that need
> only put up a scanned book that IS copyright and they will find out.

Actually, small publishing houses, and large ones, have rather small
staffs fully occupied with editing and selling books. Copyright
infringement in a civilized society is so rare, and the sort of
concerted theft that the thief Bret Ludwig pimps for so very rare,
that nobody pays much attention to copyright theft, not even the
rights manager, whose function is to license rights to other
territories, for translation, and for other media, not in the first
instance to enforce copyright compliance.

> The book is a work for hire from a company

That's a lie. It has been explained again and again that this is an
Australian book and that Australian books created by employees are
protected *everywhere in the world* for the life of the author plus 70
full years.

> that no longer exists in
> any tangible form.

This is an implied lie: Bratzi tries to claim the property dies with
the property owner. Actually, the copyright survives to to the full
term and may be, and in this case was, transferred to a new owner:
<c>Reed Educational and Professional Publishing Ltd 1997

>Like most of the classic RCA and GE tube manuals
> and educational materials published before about 1962-64 the copyright
> was not renewed at the time and because of US law and laws elsewhere
> is effectively out of copyright.

This is a whole bunch of lies and ignorant statements compounded. For a start, we're not talking about the US, we're talking about the thieves Gregg, Tim Williams and Choky Prodanovic who stole in Canada the RDH4, and claim the protection of Canadian law (which they deliberately lie about) for their theft. I'll get to the USA thefts later if their posters don't in the meanwhile take them down.

> Andre's opinions not withstanding are
> irrelevant.

This is a double negative from a semi-literate solder sniffer trying to sound sophisticated. What do you mean to say, Bratzi?

Surely, since I am the only one here who actually knows anything about copyright, courtesy of having earned my living by copyright for half a century, my knowledge and opinions are the most relevant?

> The fact that the book was reprinted is irrelevant. In fact, I
> suspect Newnes never would have bothered reprinting it if it were
> subject to copyright.

Holy Moses! And this scumball Bret Ludwig holds himself up as a copyright expert! Yo, moron, Newnes reprinted exactly *because* they owned the copyright:
<c>Reed Educational and Professional Publishing Ltd 1997

>It is very difficult for third parties to
> license old books in most cases because tracking down everyone is a
> hassle

For you, the thief Bret Ludwig, of course it is impossible, because you don't know who to approach and how to approach them. Newnes and other publishers do this every day for a living. For them it is no bother at all.

But, in any event "license" in your mouth is a lie. You're not on about licensing copyright for payment, you're just a thief and a pimp for thieves, in this case the thieves Gregg, Tim Williams and Choky Prodanovic, and their mirrors.

>and because most publishing houses in New York refuse to talk
> to anyone without a lot of money-they just can't be bothered.

Yet another lie. Most copyright licensing deals are for a few thousand dollars. Many, many translation rights, especially in novels are licensed for a few hundred dollars. Bret Ludwig doesn't know what he is talking about. It is all of a piece with his paranoid misconception of the world: little Bret against the monster publishing houses. I've worked with all the largest publishing houses in the world, and many of the smaller ones, and they're just people like everyone else.

> Andre(w) is a liar, a mountebank, and a shithead. It's likely he
> molests koala bears and craps in his neighbors' hydrangea bushes as
> well, but this as yet unproven.

These are more lies. But what does one expect from Bret Ludwig, who steals from the living and the dead and brags about it?

Andre Jute
You can find out how I know so much about copyright by visiting my books at

I would suppose that if one used some fairly high resistance wire, and had the resistance / foot data for that wire, that they could "wind" their own 11.2 ohm resistor. I may do that with my 260 some time.

They owned the same "copyright" that Lindsay Publications owns on all
the out of copyright books that they reprint: that additional or
changed material they have added, or if they have edited or deleted
things the exact things they have edited or deleted. Anyone else
besides Lindsay Publications may do the same thing Lindsay has done,

reprint a book in the public domain. They cannot add, for example, Lindsay's foreword or addenda he puts in.

Even a King James Bible has a copyright statement: they are seeking to protect the formatting and extra materials such as maps they put in. Although some do not even bother anymore with that.

Believe me, Newnes knows a great deal more than either of us about copyright and copyright enforcement and they would have long ago put the kibosh on these sites if it were improper.

> > <c>Reed Educational and Professional Publishing Ltd 1997

> They owned the same "copyright" that Lindsay Publications owns on all
> the out of copyright books that they reprint:

Then you, Bret Ludwig, or the thieves Gregg, Tim Williams and Choky
Prodanovic, or the thieves who operate their mirrors, must prove that
70 years have elapsed since the death of the last author of the RDH4.

That is clearly impossible for a book published as recently as 1953,
with a revised and expanded edition published possibly as late as 1967
creating yet another of authors and copyrights.

You're wanking hysterically, Ludwig:

> that additional or
> changed material they have added, or if they have edited or deleted
> things the exact things they have edited or deleted.

Are you blowing smoke, Ludwig, or are you growing incoherent in your
hysteria? The Newnes edition of 1997 is a facsimile edition of the
last, 1967 edition under the old copyright holder AWV. Nothing has
been added or subtracted. All that has happened is that the copyright
passed from AWV to Reed, mother company of Newnes. Copyright, for your
information, isn't a magical incantation, it is just property, exactly
like an amplifier or real estate.

>Anyone else
> besides Lindsay Publications may do the same thing Lindsay has done,
> reprint a book in the public domain.

Once the book is in the public domain, sure. But the RDH4 cannot even
begin to come into the public domain until 2014 at the very earliest
(if all the authors were dead at publication, which we know isn't so
because there were revised and expanded editions after that) and most
probably until 2038.

Assertion doesn't put a book in the public domain, Ludwig: proof is
required, and you haven't even tried to get the necessary proof.

>They cannot add, for example,
> Lindsay's foreword or addenda he puts in.

What has Lindsay got to do with the RDH4? Are you drunk or doped up
again, Ludwig?

> Even a King James Bible has a copyright statement: they are seeking
> to protect the formatting and extra materials such as maps they put
> in. Although some do not even bother anymore with that.

Everyone knows the writers of the King James Bible are dead for
several centuries now. You, Bret Ludwig, and the thieves Gregg, Tim
Williams and Choky Prodanovic have yet to prove the authors of the
RDH4 are dead, and have been dead for 70 years. You can't, because
only forty years has passed since the last revised and expanded
edition of the RDH4. Tough luck, sonny.

> Believe me, Newnes knows a great deal more than either of us about
> copyright and copyright enforcement

They certainly know more than you do, Ludwig, because you know
nothing, as is illustrated by your mantra:

>and they would have long ago put
> the kibosh on these sites if it were improper.

"We have stolen the book so often, it is now ours."

Unsigned out of contempt for thief and a pimp for thieves

2812. More lies and shit from Andrew.

It isn't anyone's. If it were they would have stopped it. It's quite
that simple.

"RDH 4 may be distributed free of charge, as has been proven beyond
reasonable doubt. "

So go and eat shit, you puke-eating cur, you sniffer of bicycle seats
and tampon applicators found outdoors.

2813. The thief Bret Ludwig says: "We stole it so often, now it is ours.:

"We have stolen the book so often, it is now ours."

You flatter yourself, Ludwig, and you flatter the thieves Gregg, Tim
Williams and Choky Prodanovic. Until someone tells them, it is
doubtful a publisher will discover some mickey mouse person on his
mickey mouse netsite offers the publisher's copyright property for
download.
>
> "RDH 4 may be distributed free of charge, as has been proven beyond
> reasonable doubt. "

Bullshit. It is in copyright, and the copyright owner is identifiable
and has been identified:
<c>Reed Educational and Professional Publishing Ltd 1997

> So go and eat shit, you puke-eating cur, you sniffer of bicycle seats
> and tampon applicators found outdoors.

Even you abuse is dull, Ludwig. You really aren't suited for
intellectual enterprise. You should stick to shooting at cans and

sniffing solder fumes.

Unsigned for the usual reasons

Me? I'm not a grass. I leave it to criminals like you, Ludwig, to dob
in the other criminals, like Gregg, Tim Williams and Choky Prodanovic.

But I don't believe you. I still want to see the e-mail you sent,
complete if you don't mind, so that I can determine whether you did
the job at all, and if your did do it, and if you did do it, did yo do
it right.

Oh dear. You really are a slow learner. These are the facts:

1. The copyright holder is the copyright holder by presumption. They
don't have to prove anything. You, the thief Bret Ludwig, have to
prove that the book is in the public domain. That is the law.

2. They don't have to tell you anything, not even a cease and desist order. That is the law. You're a nobody; you have no standing; you're just another thief.

3. You can't conclude anything from the absence of a cease and desist order. You will still be a thief, and so will Gregg, Tim Williams and Choky.

> They can't.

4. The law is that the wannabes like you must prove they are not thieves. The copyright holder has to do nothing, absolutely nothing, SFFA. That too is the law.

You've made a fool of yourself, Ludwig, for no gain at all.

You've made a fool of yourself because you are out of your depth, Ludwig. I have explained several times how this works but you have either failed to understand or you are such a jerkup that you think your wishful thinking substitutes for the law of the land. (That last is a good definition of a sociopath.)

Unsigned out of contempt for a tattletale and a fool

You're a moral idiot.

There is no fault in notifying the authorities of a crime provided
you yourself were not in on the crime. It's when a co-conspirator rats
out his fellows that one can be called a snitch. Would you ignore the
robbing of an old lady on the street so as not to be a "grass"?

And no, I will not post the email. If you are so big on doing the job
why not wrote from all the sockpuppet accounts you post here on when
you are having a bad period?

Anything is possible, of course. But it is a proven fact that you, Bret Ludwig is an immoral thief. The only thing shorter than your decency is your dick.

> There is no fault in notifying the authorities of a crime provided

Of course not, nor the theft of the RDH4 copyright by Gregg, Tim Williams and Choky Prodanovic, with Bret Ludwig as their tout. Nor, for that matter, the theft from me by the scumball Bret Ludwig.

> And no, I will not post the email. If you are so big on doing the job

It is not that I want to do the job, it is that I want to check you didn't deliberately send the e-mail to the wrong address. We know you are dishonest, a thief in fact, so why should we take your word for anything.

> why not wrote from all the sockpuppet accounts you post here on when

No, Horse's Ass, you must prove that the authors, rather than the corporation that financed, assembled and published the book, owned
the copyright.

Otherwise, by the rules of usenet, you'll have to go to hell.

You keep bragging about your publishing experience; this should be a walk in the park for the well connected magnate you claim to
be. Hell, dude, call one of your friends at the CIA or Interpol! They'll be able to research it for you.

But you won't, and you can't, provide anything but more horseshit.

Because you're just another horse's ass.

Nobody, certainly not me, said the authors of the RDH3 owned the copyright. I repeatedly said that AWV first owned the copyright, for a fortnight I've said it. You should get your eyes and ears tested, anonymous Phreaddie, or take remedial comprehension lessons.

Australian law says that when an employee creates a book, the employer owns it. The term of the copyright for such a corporate copyright under Australian law is for the *author's life plus 70 years from the year after his death*. Since first publication was 1953, with revised and expanded editions following until 1967, the RDH4 cannot even begin to go out of copyright before at least 2024 and possibly not even until 2038.

Australian law says that when an employee creates a book, the employer
owns it. The term of the copyright for such a corporate copyright
under Australian law is for the *author's life plus 70 years from the
year after his death*. Since first publication was 1953, with revised
and expanded editions following until 1967, the RDH4 cannot even begin
to go out of copyright before at least 2024 and possibly not even
until 2038.

The copyrightholder therefore owns the content until 70 years after
the author's death, a period that cannot even begin before 2024 and
possibly 2038.

All this speculation by you boys is futile wanking.

This is such a profoundly stupid complaint you have, Mr. McJute.

Let's assume that the copyright *IS* still owned by RDH4, or whoever you THINK owns it.

In order to enforce their copyright, they would have to engage in legal actions. This would normally start with a "cease and desist" letter. For any publishing company, this would require at least a meeting between attorney and probably several management level employees, the lawyer would then go off and research the issue, and write the C&D. This would then be forwarded back the the client; they would circulate the draft among the management employees and likely have at least minor changes to the form and substance of the letter. The attorney would rewrite, and assuming all goes well receive approval from the client to issue it.

The attorney would then need to locate the exact details of the owner of the website in question (and from what I gather this material is routinely available from a number of websites). Research would be done and perhaps at long last the C&D would be sent, probably by some kind of signed courier.

Total cost? Easily US$5000, perhaps up to US$10,000.

MORE THAN ANY ROYALTIES BEING RECEIVED BY RDH4 FOR THIS COPYRIGHT!

What you don't seem to understand about business, Mr. McJute is that these kinds of management decisions are made by experienced business people every day of the week. They are decisions based on sound business practice and not "vanity". You've clearly published several "vanity" editions of so-called novels, and rightly believe that you should enforce your copyright to this drivel. That's your right, and you might actually prevail (there being no evidence that even with the miniscule cost of digital storage, no one has yet seen any purpose to steal your vanity books).

There would be no business sense for RDH4 to enforce such a copyright, even if they are the owner. The demand for these publications is near zero -

they are antiquated reference books at best and I would guess many libraries that might have a copy would be in the process of getting rid of it, as libraries routinely do with out-of-date scientific publications.

Many in fact would agree that digital availability for books of this type is a public service, that these volumes have actually been liberated from their lack of circulation.

You're apparently one of them anal-retentive troglidytes

ARRL Article at URL:
http://www.arrl.org/news/features/2007/09/28/03/

Sez
The Transmitters

The radios on board Sputnik are described as D-200 units and were designed by a member of Korolev's design team named V. I. Lappo. 11 The meaning of the D-200 designation is unclear and our research thus far has failed to produce a schematic of this transmitter, but Tikhonravov, in a presentation before the 24th International Astronautical Congress in 1973, characterized the transmitters as "vacuum valve-type" with a power of 1 watt. 12 Figure 3 shows the transmitter unit mounted adjacent to the antenna connections in the front casing half. One transmitter operated on a frequency of 20.005 MHz (megacycles in 1957) and the other on 40.002 MHz. The choice of these frequencies not only allowed reception by amateurs using existing equipment but also enabled a receiver set at exactly 20 or 40 MHz to produce an audio tone plus or minus the Doppler shift without ever going through zero Hz. This insured that the telemetry was audible throughout an entire pass without additional tuning of the receiver.

Lamont who saw the booster rocket in the sky in 1957.

As I recall an Amateur at Convair Pomona -- heard transmissions on his Ham gear.

There is a great deal of technical information on Sputnik here (no
diagrams) http://www.arrl.org/news/features/2007/09/28/03/

The article makes reference to the Institute of Radio Technology
whereby they flew a duplicate of the Sputnik 20 Mhz transmitter for
receiving practice. I made a quick search, but didn't find anything
on that organization.

Large publishing concerns have attorneys on staff, who have nothing
else to do, besides this. It takes one about ten minutes to run off a
form letter and send it FedEx to the people involved. It takes even
less to send an email stating that we believe this is inappropriate
use of our IP to someone's ISP. We are talking fifty to a hundred
dollars of company time as internally billed.

Even if the amount is trivial, large publishers, and most small ones, do the level best they can to stop unauthorized use of any and all lawful IP. If you in good faith, with an active email address, put up something not in the public domain it will not be long before you hear about it.

RDH 4 is absolutely and positively public domain now.

A lot of desireable material isn't and arguably ought to be. I have of course written my legislators, two of which are neocon fellating whores and one basically a lazy careerist, so it is a waste of postage. but what I view as good citizenship on my part.

Good morning... Looking for the BEST place to mail-order replacement caps and other components for restoring boat anchors.

I did the deja and google searches and got the usual hundreds of thousands of hits, now I'd like to know what you guys consider the best place to deal with mail order.

Current project is a DX-40 and I need some 40-uf 450-V electrolytics and replacements for a few misc. paper caps.

Radio Shack has nothing, as usual.

I suppose ordering two electrolytic capacitors and two paper cap replacements will be a losing proposition because they'll raid me for more on shipping and handling charges than the caps are worth, but if there is anyone out there who's reasonable on that kind of stuff I'd appreciate hearing about them.

I suppose if I'm going to get into this boat anchor stuff I should buy an assortment of caps and other parts... any suggestions there?

> Otherwise, you'd really have to define your definition of BEST.

Good afternoon, observer.

Well, of course "best" is subjective, but I'd like to hear people's own personal favorites based on their own definition of "best".

I consider "best" in terms of good inventory, reasonable prices, and reasonable shipping and handling fees. I especially don't like paying more in shipping and 'handling" fees than I pay for the merchandise.

I have dealt with Digikey in the past and always found them a bit pricey but with good inventory and good response. Haven't tried Mouser yet... will give them a shot.

Thanks...

Digikey and Mouser are good, if you don't mind wading through their
catalogs carefully to figure out which modern components are just right
for you.

Antique Radio Supply (www.tubesandmore.com) has a selection of
high-voltage new capacitors (including some low-end audiophool stuff, so
watch that price column!). They also have some specialty reproduction
electrolytic capacitors if you want to retain the right look to your
chassis -- this is a 'don't care' for functionality, but if you're doing
something with an open back you may want to let people see that aluminum
can sticking up instead of some ugly blue thing.

> Thanks,

That looks right. Unless I was willing to do some analysis I'd replace them with tantalums that have the same general look, and expect to replace them again down the road. The only real alternative that would approach the size are niobium or other rare-earth caps which have aging and performance characteristics that are substantially the same as tantalums, or some of the newer aluminum electrolytic caps which will tend to have a shorter life (although with less dramatic failure modes).

Yeah, I suppose with mods it would have been ok. A friend bought Yaesu FT-ONE transceiver from an estate sale, and it had a fantastic receiver in it. I wanted one really bad until I realized that his had been extensively modded with PIN Diodes, and was tremendously better than a stock radio was. By the time I found one that was reasonably priced enough to get fix and modify, I didn't want to mess with it anymore.

Tantalums are quite reliable if you choose them correctly.

The usual causes of short life are the magnitude of applied voltage, and charge/discharge current. As a rule of thumb, pick a capacitor that has a voltage rating that is a minimum of 2 times the maximum voltage the capacitor will ever see, and you should be ok.

High charge and discharge currents can sometimes be solved by using a series resistor between the source that you are filtering, and the capacitor that is doing the filtering.

Applying reverse polarity will cause an extremely short life.

Quite simply..... Mouser. I've tried the others, from time to time, and always return to Mouser. They have what I need and I have not been disappointed with items not being in stock. As an aside, the price of can electrolytics from Antique are... well, let's just say overly expensive for what you get. I simply put small tubulars underneath the chassis and be done with it. de K3HVG

I got one at swapmeet with a problem. It works fine on the Short side
but on the Open side on check the eye stays open instead of being
closed. The wiring and tube seem OK. The schematic I have shows a 5mmf
cap across the osc coil but I don't see one and wonder if it was missing
from the factory because the parts list doesn't show a 5mmf cap. I'm
guessing the coil came with both caps as an assembly or my unit is a
later one and they may have figured out a way to wind the coil where
they don't need it. Anyone know? Scoping the grid I can see a flash of
high freq. osc momentarily but that's switching in the Short side.
tnx

The manual I have for the CT-1 shows a 10 pf capacitor across the oscillator coil, however, it's not in the parts list either. The oscillator coil must have come from the factory assembled with a tuning capacitor that made the circuit oscillate at the correct frequency.
Do you have a complete manual that gives the circuit theory of operation? That section describes both open and short checks as well as normal operation. If not, I can send you a PDF of the manual.

Cheers!!!

No joy... neither of them has any 40-uf 450-volt electrolytics in stock.
Both of them say mid-December which usually means "at the earliest".

I know I can build what I need out of different values in series-parallel
but I'd rather save that as a last resort.

I also tried searching for values from 20 uf up to 80 uf at 450 to 600
volts and no luck.

Yeah, unfortunately not this time... no stock on anything from 20 to 50 uf
and 450 to 600 volts. Best guess on delivery is mid December, which
almost always means "at the earliest".

In this case the small axial-lead tubulars is what I need.

Their tubular axial leads aren't bad, though... I just found some 47-uf 450-volt axials for $2.81 each vs. $10 - $16 for Mouser and Digikey (the ones of which they have no stock).

Henry, I just opened mine and it has a 10pF NPO ceramic across the end
of the coil opposite the green dot [the left end looking from the
rear]. The frequency of the oscillation in not as critical as it
operating over the range of loads, so I should try 10pF and see how it
works with a variety of capacitor values under test. If it craps out
at either end of the load range, try 5, 15 or 20pF and see how it
goes.

Hi Neil
Mine has the 10mmf on the end opposite the green dot..
But my schematic shows a 5mmf across the big coil which mine doesn't
have..
Does yours have a 5 mmf on the coil as shown on the schematic and in
Fig. 3 page 11?
tnx

The CT-1 uses an oscillator tuned to approximately 19 MHz for the open test. It does not matter if it is 21 MHz or 17 MHz, and there will be no difference between a 5 pf or a 10 pf or no pf across the coil.

If no one got offended, I would say that you are barking up the wrong tree. But, I do not want to hurt anyone's feelings, so I will not say that. My dog would not get her feelings hurt if I talked like that to her, but people do.

The problem is elsewhere.

One of the problems, when you pick up something that does not work, is assuming that it ever worked. Sometimes kits were assembled, and did not work, then put on the shelf where they languished for decades.

Check the wiring and check to see if the oscillator is oscillating. Sometimes switch contacts are wired incorectly. Sometimes switches are improperly cleaned then fail Sometimes resistors fail.

In the past, we check the paper and electrolytic caps. Now, we may need to check the mica caps.

I second the vote for www.justradios.com.

David provides excellent service, lightning fast shipment and capacitors are fresh. I've recapped many radios with his caps and you can;t go wrong.

good statement - don't assume it ever worked - at one time I made my spare change fixing kits that the purchasers couldn't assemble correctly.

Thank you, Chuck. The existing tantalums in the receiver lived for about 25 years so I guess that's not considered "short life". The one that failed did so in a rather startling way. Scared the bejeezus out of me when it exploded and let loose a bunch of smoke.

I guess if I get 25 years out of it's replacement I'll be happy..

I have a friend, a retired lawyer who once worked for McGraw-Hill. He does not normally read the newsgroups but I sent him the google link to this thread, and he emailed me back his response. Here it is:

"Mr. Ludwig is absolutely correct when he says that the large concerns have many lawyers and paralegals on staff who are solely devoted to tracking down infringing parties. Much of that activity stems from the fact that U.S. copyright law and legal precedent demands that the holders of copyright defend their properties vigorously or risk loss of the copyright.

So, if an infringement is discovered, the identified infringer will be sent a C & D letter, even if the material in question is of little immediate value to the holder. The C & D letter costs the holder very little to send, and will at least establish some diligence on the part of the copyright holder to assert and protect the holder's copyright of the material. Most of the time, the infringer takes steps to stop the infringement upon receipt of the letter, and that's the end of that. It is situations where the infringer does not act-ignores the C & D letter- where the decision of what to do next becomes dicey.

If the material is an original, artistic work, then the publisher who holds copyright will most likely go ahead with a lawsuit, because there is at least some possibility that the work will continue to be enjoyed by a significant number of people far into the future.

However, in the case of old, outdated reference material, there is likely going to be some sort of a value test done before the holder will go further. In a perfect world, the holder would take whatever action is necessary to stop infringement in every single instance, but the world we live in is one that is driven by economics and practicality. If the materials in question are non-artistic, antiquated, and out-of-print, the up-front costs of securing a judgement against an infringer will likely exceed the value of the item being infringed. Although there are mechanisms to recover some of these costs from an infringing party that chooses to ignore a C & D letter, the reality is that recovery of these costs in the short term is often quite difficult, and often difficult in the longer term as well. The holder may well find that they have spent all this money to pursue an infringer who has no assets that can be attached. The phrase "you can't squeeze blood from a stone" really applies here. It is for this reason that casual copyright infringement, which occurs millions of times per day on the internet, is rarely prosecuted.

With regards to Mr Jute, his interpretation of the strength of Australian copyright law, as it applies in the USA, is quite fanciful, to say the least. If you are going to prosecute an infringer in an American court, the law that is going to referenced in that case is American law, period. Australian law will only be considered to the extent that it matches the American statutes exactly. If the publication dates stated previously are correct, then the "RDH4" publication that is being discussed here had a USA copyright period of 28 years before entering public domain UNLESS the holder took explicit legal steps to extend the period another 28 years (later expanded to 65 years and modified again to 70 years beyond the author's death). No extension, no protection now for works produced in that era. In the case of a reference work such as the "RDH4" the question of whether or not the copyright was extended is FAR from certain. There are many that were extended and many more that were not. If the person who is publishing it on the internet has not received a C&D letter within a few weeks or months, I would suspect that the "RDH4" is indeed public domain at this point, but I would not be certain.

Now, a publisher might choose to pursue litigation in an Australian court, and might get a judgement there, but all of the same issues of recouping the costs outlined above come into play, and if the infringer is located in some other place than Australia the difficulty of recouping those costs take on a whole new dimension."

So, there you have it....An opinion from someone who has been there, done that.

-Scott

I have a nice HQ-180A with a problem. The 455 kHz IF is
too narrow. There appears to be some regeneration going
on because the gain also appears to be too high. Unfortunately,
the component density is not conducive to just randomly
replacing parts. Has anyone else had this problem? Any
ideas greatfully appreciated.

You haven't read the threads, Scott. We are not at the moment talking about US copyright but about the thieves Gregg, Tim Williams and Choky Prodanovic who claim that their lies about Canadaian copyright protects their theft of the RDH4. Last time I heard, Canada was not yet a State in United States of America.

As I have already pointed out to the permanently irrelevant Flipper, it is a particularly American arrogance to assume when someone shouts "Stop, thief!" that all Americans should instantly call their attorneys to start blowing smoke to cover their guilt.

I'll see you when I start on the US copyright thieves. Meanwhile, if you want to play, raise your eyes to the horizon.

Andre Jute
Hell, these days even Chinese smoke is superior to made-in-the-USA smoke

Hello Roger:

I expect the selectivity is too narrow because of the regeneration. Regeneration also increases the gain. It may need to be realigned according to the manual - but I would not do that until you find the cause of the regeneration.

It could be a tube, but more likely it is a defective bypass - either in the plate/screen leads to the if stage or the grid bypass. Since all of these caps are ceramic disc caps, they should still be good.

Start with the simple stuff and measure the voltage and resistance as specified in the manual, on the if stages.

Remember to find the problem before alignment.

They are for all intent and purposes the same. TMC issued updates - 4
or 5 IIRC - during the production runs - many of which were made to
units as they either went through depot level maintenance - or in the
field by a tech who would decide to install it on their own. AFAIK other
than the mods - the only difference between th cv-591 and the cv-1722 is
the production contracts (dates).

Hi all. I have a 45 that is one of the old hallicrafters. Wonder what this record is worth? If anyone has an idea, or could give me a ball park figure, please e-mail back. Don't check the news group that much. Thanks from Dana in Griffin, Georgia.

Does anyone in this group have a Hallicrafters SX-43 or SX-42 that still has the cardstock cover over the tuning access holes on the bottom?? I am looking for a photo of the cover marking to create a properly marked replica.

Thanks,
Neil S.

I checked mine and the schematic does not show any cap across the
'large' coil, nor is there one. You might check the cathode for

oscillation activity since virtually any capacitance across the secondary will kill the oscillation [even a 'scope probe]. There is not a whole lot in there to go wrong, so you might check the eye tube triode for emission; if it is weak that could be a problem, or if it has been inactive for a long time. Mine has not been used since I refurbished it 10 or so years ago, and it worked immediately I turned it on and the tube warmed up.

2882. FS: ME-26D/U VTVM

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-10-10 20:48:23 UTC
From: Barry <n4buq@knology.net>
Message-ID: <1192049303.435540.79870@19g2000hsx.googlegroups.com>
Source record: 6734

For Sale: ME-26D/U VTVM. This is the military version of the HP410B.
All functions work. The only problem I had with it was a broken
connection to the capacitor in the AC probe. This is a little
"button" capacitor with a threaded spindle and the threaded spindle
separated from the body. I soldered it back together and it works
fine now. Includes probes and an original shipping box (serial
numbers for unit and shipping box do not match, though).

http://www.knology.net/~thelanding/ME-26DU/Front.jpg
http://www.knology.net/~thelanding/ME-26DU/BackOpen.jpg
http://www.knology.net/~thelanding/ME-26DU/BackCover.jpg
http://www.knology.net/~thelanding/ME-26DU/Oblique.jpg
http://www.knology.net/~thelanding/ME-26DU/Oblique2.jpg
http://www.knology.net/~thelanding/ME-26DU/Oblique3.jpg
http://www.knology.net/~thelanding/ME-26DU/Package.jpg
http://www.knology.net/~thelanding/ME-26DU/Plug.jpg
http://www.knology.net/~thelanding/ME-26DU/Side.jpg
http://www.knology.net/~thelanding/ME-26DU/Top.jpg
http://www.knology.net/~thelanding/ME-26DU/Accs.jpg
http://www.knology.net/~thelanding/ME-26DU/Manual.jpg

Note that the manual is for an ME-26B/U. The "A" model was the
HP410B, but the B, C, and D models utilize a different cabinet design
and different meter movement.

Asking $40 plus shipping from 35824.

Thanks,

Barry - N4BUQ

Hi Al,

I used to sell them at Amateur Radio Supply (Seattle) in the mid 70s, when I was young & foolish. I'm not so young now (but still foolish). 8-)
A Cinch-Jones #P-310-AB is a 10 pin (male, chassis-mount) connector but you specified you need 12 pins. The part numbering scheme for Jones connectors is:
P = male pins, S = female pins
3/4nn = series and number of pins
AB = chassis mount
CCT = cable mount

Much more info about is here: http://www.tresco.com/

Source record: 6743

Hi

I have recently acquired a 2B receiver and its 2BQ multiplier. The latter was missing all mounting screws and had a replacement speaker fitted. I note the manual refers to fitting fibre washers behind the 2BQ front grille when attaching it to the cabinet.

Can anyone advise me whether the earth speaker lead should be earthed to the 2BQ cabinet? Likewise what purpose do the fibre washers serve? The 2BQ chassis seems to be earthed via the coax to the 2B and electrically attached to the front grille, so that the sheet metal screws themselves would electrically connect it to the cabinet albeit not very well, whether or not fibre washers were used.

Thanks

Simon VK2UA

Thanks for the info; maybe the washers serve no electrical purpose but
are there to stop the grille vibrating if some screws are loose or missing?

Fiber washers are also common in consumer grade vintage Philco radios.
Mostly they are missing but are present in un molested units.

They surve no eletrical or electronic fuction. They seem to be there for a
physical mechanical and or acousital reason.

This may help. I bet it may be mentioned in the RCA Radiotron book. I'll
look next time I am in the shop.

Speakers in metal boxes are prone to resonate somewhere. I would be willing to bet 5 cents that the reason they are there is to prevent unwanted resonances.

Regarding the speaker common lead, it is common to avoid a common ground, which could cause ground loop problems (hum). Usually, the manufacturer knows best and all you need to do is put it back to the way the engineers had it in the first place, and it will work as it was supposed to.

It may well be alignment. Those 60 kcs IF's must be in alignment per the manual or it will seem too narrow. Do that after checking the tubes in the IF area (My experience is with the HQ-170 and HC-10).

The 60Kcs IF set the filter alignment for all of the selections (500hz, 1, 2, and 3 as I recall) double those values when switched to AM.

Hope you have the alignment part of the manual.

If that does not work check resistances and voltages.

Thanks Colin, unfortunately ones gets boatanchor gear, as in this case,
where it is not as the manufacturer supplied it. The speaker had been
replaced and if the fibre washers had related to an electrical purpose,
an earth wire might have been relevant. I know than normally speaker
connections do not need to be earthed anywhere, but in the 2-B the
chassis is marked "spkr" and "earth".

This particular set also arrived with the 15 & 10 metre bands dead and
the problem was that the Xtal coil adjustment on 10m was way out -
people do fiddle when they don't know the consequences.

I have a somewhat-odd request:

I am looking for color-matched knobs, banana jacks, binding-posts,
banana plugs, etc. Matching colored wires would be really cool too.

Having at least eight distinct colors available would be really nice.
I know that last one is difficult because I'm a very typical male who
cannot name more than four different colors off the top of his head.
But I have no problem looking at any color-coded resistor and having
the value and tolerance immediately register in big shining numbers in
my brain, so I don't think the problem is my eyes, I think it's just
that I'm male :-).

I believe that HH Smith etc. used to do stuff like this and while
they're still around I don't see any colors but red and black in their
catalog.

Looking in the Digikey catalog they list "Emerson"/"Johnson" as the
maker of some banana plugs and jacks available in ten colors. If I
could get matching colored knobs and maybe even test lead wire, I
would be so so happy.

Any leads (including just "how to paint random knobs in matching
colors") would be greatly appreciated.

In case nobody else has figured it out yet, this is for a super-duper
bench tube tester that currently is just a bunch of stuff scattered
across my bench but which in my head I could turn into one mega-super
tube tester/curve tracer. Black would of course be ground, and I
suppose the two filaments should be green, and maybe the cathode can
be black, but I still need three other colors (plate, grid, screen)
and at the moment can only name two, so seeing a catalog page with a
color-coded lineup of everything would so make my vision come true!
Many decades ago I saw a picture in a magazine of what to my juvenile
eyes looked like what must be the ultimate tube tester of all time,
and while I do not remember the model or make I do clearly remember
row after row of gleaming colored knobs and jacks. Does this
description ring a bell with anyone?

Tim.

I believe Kilo sells anodized knobs in a few different colors, still, and
that Pomona Electronics should have a few colors of banana jack.

>Any leads (including just "how to paint random knobs in matching

Go to the auto parts store and get cans of automotive lacquer. It gives
a nice even finish on generic aluminum knobs and comes in more colors
than you can imagine.

Filaments are brown. Red is plate. Grid and screen are orange and
yellow but I forget which is which. There's a RETMA standard for all
this stuff somewhere.

AES, http://www.tubesandmore.com/, has knobs in 8 colors. Click on "Knobs"
in the left hand column. In the next screen click on "Chicken Head".

I've never seen test lead wire in more than 4 colors. If you can use
ordinary wire, colors shouldn't be a problem.

I have seen test wire in more than 4 colors. It is actually in the Belden
catalog I have -- BUT the minimum order (in feet/spool) for any color other
than red or black is high (at least 1000 feet, as I remember)

It does look cool when properly set-up. Old EF Johnson and HH Smith banana
jacks did have several colors. Needs any in blue? I have several panel
mount banana jacks in that color.

Hello,

I recently found this great transmitter, and went to great lengths to get it out from the back of a huge old warehouse.

Unfortunately, the manual seems scarce.

I would like to buy, borrow, copy, etc.. the manual so I can fix the set. Usually a manual wouldn't be strictly necessary, but the set is difficult to service since when you slide any of the drawers out, it's instantly disconnected from the frame wiring! ha!

(Anyone got a "service cable" for it? Other owners of the URT-12?)

So, if anyone is kind enough to make available a manual I would appreciate it greatly.

Pictures of the set (I have not had time to clean the cabinet, sorry) are here:

http://www.bunkerofdoom.com/mil/urt12/index.html

I think it's a good piece of Coast Guard history, I'd like to restore it. - and get it on the air!

Thank you,

Patrick Jankowiak

Not really (the one at the local Radio Shack (way in the back in
1970-something when I was getting an old Hallicrafters up and running)
was more boring - blue and white with brown sockets and black knobs, as
I recall), but I suspect that certain auction sites probably have
exactly the thing you were looking at available from time to time. All
the other old junque shows up there.

Not to deny you the joy of building, or anything like that - but if it
was made, there are probably examples out ion the wild to buy, if you
look for them.

Nortex Electronics
In Memory of Lewis E. Cearly Jr., Proprietor
Lewis Cearley, 84, passed away Friday, Oct. 5, 2007, at a local hospital. Funeral: 1:30 p.m. Tuesday in Greenwood Chapel. Interment: Greenwood Memorial Park. Visitation: 6 to 8 p.m. Monday at Greenwood Funeral Home. Pallbearers: Gordon Callaway, Ed Forrester, Bob Martin, Ken McAllister, Mike Stroud, Jimmy Waters. Honorary pallbearers: Bob Carr, Bryan Goulette, Perry Hale, Steve Haney, Jerry McKinney, Robert Plum, Pete Pratt, Mark Rosso. Lewis was born July 21, 1923, to Lewis E. Cearley and Ina Carson Cearley in Childress. His family moved to Fort Worth in 1936. He graduated from Tech High School and joined the Navy in 1942. He served on the aircraft carrier, Tulagi, in the South Pacific, participating in three invasions, plus always dodging the kamikaze. Lewis enjoyed participating in squadron reunions. Lewis developed an intense interest in electronics at an early age; for example, he wired an entire house when he was 14. He started the Cearley Co. on Pennsylvania Avenue in 1954. In 1976, he established Nortex Electronics on West Vickery Boulevard, passing out advice, spare parts and good cheer until a month before his death. Lewis and Joy Cearley were married in 1967, putting an end to his happy bachelor days. They celebrated their 40th anniversary on Aug. 12, 2007. His stepson, John Watson, died in 2001. Survivors: Wife, Joy; sister, Sylvia Cearley of Fort Worth; stepdaughter, Kay Haddaway and husband, Richard of Santa Fe; stepdaughter-in-law, Brenda Watson of College Station; stepgrandsons, James Haddaway and wife, Shannon of Fort Worth, Keith Watson of College Station; stepgranddaughter, Dr. Kimberly Hill and husband, Jeff of Georgetown; and stepgreat-grandchildren, George Haddaway, Vivian Haddaway, Ethan Hill and Avery Hill. Published in the Star-Telegram on 10/7/2007.
Lewis was a great friend to many electroncs and photography enthusiasts and is sorely missed. Lewis was my very good friend. During the week of Monday OCT 15 through Saturday OCT 20, 2007, the store will be open to the public to make any final purchases.
It is strongly recommended to do so, as after this, the store will be closed and all goods will be recycled.
NOTE: Thursday-Saturday of the above week is a special and very final "garage sale" also open to the public.

I'm very sorry to read this sad news.I had the pleasure of meeting Lewis a few years ago when I came over to Dallas, with some other Brits, for the Microwave Update convention. Kent Britain, WA5VJB, drove a few of us around the area all day, calling in at various surplus stores, one of them being Nortex. I was really amazed at the stuff Lewis had there! There's nothing like it over here in the UK.

At that time Lewis told me he was considerng selling the business but I guess he didn't after all.

If anyone over there in in contact with his family please pass along our sincere condolences, not only from myself but from the other Gs who met him that day... ie G6GXK, G3PYB, G4DDK, G8UBN and myself, G3PHO

In fact, following the lead of Alan Douglas, I think in my head the
unit I had seen in a picture was the Weston CA-1630. Nice pic here:

http://www.tubedepot.com/tt-ca-1630.html

At circa $5000 I think I'll have to pass, but it's a beaut.

I think in my mind I want even more color matching than in the
original - I just see black and red binding posts there, in my head
the posts should match the knob should match the element. So it looks
like the decades have elaborated the original, to the point where I
desire something more than the original :-).

Like Scott Dorsey suggested, probably the way for me to go is to get 5
or 6 or 7 different color banana jacks and paint the knobs to match,
as it seems increasingly unlikely I'll get much match in "raw" knob
color, but still thanks to the others who posted about the multi-color
chickenheads available from AES (I had actually bought them in the
past!) and the knobs from Small Bear.

Tim.

Allied!http://www.pomonaelectronics.com/pdf/d1325-5230-5406-6546_100.pdf

Actually, ten colors available! 0-9 is ten, not nine. Sometimes I fall
into FORTRAN mode too so I won't blame you for being off by one :-).

I don't know if the Pomona parts are 100% identical, but I just
ordered a few sets from Digikey sold under the "Emerson/Johnson" name.
I'm guessing they're all made in China by the same company:

http://dkc3.digikey.com/PDF/T073/P0372.pdf

Using color-coded Banana plugs/jacks seems preferable to having
massive crossbar wiring, at least in my head.

Question for anyone who has used the Weston CA-1630: Am I correct that
there are pushbuttons in many of the knobs and this is somehow related
to either removing the function of the knob (pin selection) or
selecting that knob's function for stepping during curve tracing
(grid, plate, screen)?

Really wonderful link to a big pic (may not work!) showing the CA-1630
set up to test a 300B:

http://us.st11.yimg.com/us.st.yimg.com/I/yhst-8476489043850_1968_29319026

Hey, I grew up holding 60/40 solder in my mouth while plugging krypton-85 filled regulator tubes in my left hand and turning knobs just inches away from radium-filled meters with my right hand. None of it made in china. And I'm perfectly normal!

Joking aside, it's pretty obvious that a test set with 1000V B+ running around obviously won't be in my kids' hands much less in their mouths.

Source record: 6628

For Sale: Two CDE AR-22 Rotors with Control Boxes that need some minor work.
I will sell them for $45 each.
The controls light up and the motors on both rotors work. Operation is
intermittent. They probably need cleaning and
lubed and maybe the caps changed in the control boxes. They look very nice
and have all mounting hardware including
the lower masts attachments. Also included are the manuals. Shipping is
extra. Thanks, Charlie Hugg, K5MBX

I suspect the lead content on them is much lower than it should be. The
Chinese are not exactly big into making quality phosphor bronze and most
of these sorts of parts coming from China tend to be made from cheap and
gummy cartridge brass. That's okay for the socket, not so good for the plug.

What was the name? Do you have any other info to go on? Maybe others still living - who your family can contact from that list - might be able to provide additional clues - like the area they were from. Undoubtedly, that would give you a "call" area to look under as well as any name.

W5YI insists they can do some searches, not sure if they can go that far back.

What makes you think he was a ham?

After all, the greeting was used on the wired telegraph system. For
that matter, likely it carried over to commercial radiotelegraphy.

That doesn't mean anything, except that they may never had a ham
license.

2933. Paper capacitor recap opinions?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-10-16 18:41:16 UTC
From: SX-88 <nospamtelegrapher@hotmail.com>
Message-ID: <13ha1fb49cj9sae@corp.supernews.com>
Source record: 6636

I am in the process of recapping one of my receivers that uses many 0.05 MFD paper caps. Since 0.05s are not READILY available, I am split equally on the following:

1. Do I recap using the more readily available 0.047 MFD caps even though they are of less capacity than the original? OR...

2. Do I recap by paralleling readily available 0.022 and 0.033 for a total capacity of 0.055 MFD?

If I do the 0.047 replacement I am violating the rule I have had beaten in to me about NEVER allow a capacitor to be of LESS capacity...but when they are higher it is OK. However 0.047 MF is only 0.003 MFD off the target 0.05 MFD value whereas the "safer" higher parallel combination (0.055 MFD) is 0.005 MFD higher than the target capacity.

Thoughts? My receiver uses a lot of the 0.05s so it is not like I only have one or two to consider.

Thanks for any help.

Gary

Gary,
Personal opinion here... I wouldn't hesitate for a heartbeat
to put in the .047s. They're well within the manufacturer's margin
of error in any case. And single .047s are much cheaper and
better looking than a bunch of paralleled caps.
Also... personal opinion as well, I've intentionally used much
smaller caps than OEM in some circuit locations, such as line
bypasses.
Cheers,
Nelson

I third the motion. You can actually calculate the needed capacity in any particular circuit, whether it be bypassing or coupling. The chance that any particular .05ufd capacitor originally used by the reeceiver manufacturer would be the calculated value is about as as slim as finding a nice SX-88 at a landfill. Ballpark is close enough, unless it is in a tuned circuit.

And, the capacitors usually have a tolerance far greater than the .03 ufd difference.

Use the .047 and do not give it another thought.

3000 pF isn't going to make much difference in a .05 mFd bypass. You can get
the .05
values from NTE if you feel the need to keep it original. JustRadios.com
probably
has them too. Personally, I'd use the best quality axial lead yellow
jackets I could find.
If you really want to keep it original, consider
restuffing the old cardboard shells from the wax caps to preserve the under
chassis
appearance.

Pete

Note that some of these WILL be in tuned circuits, and you'll almost certainly
need to realign the receiver with a sweep generator afterward. But that is
not a bad thing.

>And, the capacitors usually have a tolerance far greater than the .03 ufd

Yes, figure 20% tolerances on those things.

>Use the .047 and do not give it another thought.

If you really worry, you can get .05 uF orange drops.

This comming Sunday...
The Seasons Last...

+++ Now even more Buyers Parking !!!
Thanks to Shire we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday October 21st 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,
will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

One more thought Gary,
You can look at the application and determine what the purpose of the
capacitor is, the approximate frequency, and the Xc of the capacitor
at that frequency. For instance, it it is in the IF amplifier stage,
you know that the frequency is 455KHz, and can calculate Xc. From
that, you can determine what range of values makes sense to replace
into the radio.
That said, remember that those paper capacitors had values given at
+/-20% tolerance. So why do you have a rule beat into you that you
never replace a capacitor with a value less than the original?
I just re-capped a Hallicrafters S-53A. The paper capacitors are ALL
rated at 600V. However, many of them are in low voltage applications,
and never see more that 30 volts accross them. Why put in a HUGE paper
capacitor? Because it was cheaper for the company to stock just one
part type and use it wherever a .01uF capacitor was needed.
So it is OK to question why a given component is where it is, and make
a judgement call on what would be a good replacement.

Also, as I replace the paper capacitors, I like to wear gloves. The wax is kind of nasty to get on you.
Have fun, and good luck,
Gary

2943. FS CDE 44 Rotor

> about as as slim as finding a nice SX-88 at a landfill.

Hey, whaddya mean?!?

http://www.antiqueradio.org/dumpster.htm

:-)

Phil Nelson
Phil's Old Radios
http://antiqueradio.org/html

P.S. I agree with other responders that the .047 is a fine replacement. Since the old caps were manufactured to such a wide tolerance, your modern replacements may be closer to the specified value than most of the originals!

2945. Re: Paper capacitor recap opinions?

Source record: 6648

And, Phil's website is as good and concise as it gets about replacing capacitors. See http://antiqueradio.org/recap.htm

Even if you have been doing it for years, you will appreciate Phil's nice writing style and useful information.

And, a big fat A for taking the time to help spread his wisdom, learned from years of experience.

Even after years of repairing radios, we learn that we can do it better. A few years ago I was going to replace a paper cap in a 17 tube receiver. I do them one at a time. I clipped the old one out, got a phone call and dinner call and shut the soldering iron off and left. I was not able to return to the work for about a month. By then, I knew there was a capacitor out - but I had clipped the old leads off and it took me an hour of tracing and schematic reading before I could determine where the missing capacitor was. Now, I am more methodical and make notes before I clip the capacitor. A notebook and pencil are always nearby to document before I start work. Life has been much simpler since then. And, it really is a good idea to test the radio after a maximum number of changes.

Colin K7FM

Keep a cheap set of imported clip leads handy. Place a set over the snipped leads to "remind" where the old part was snipped from.

Digital photos of sections of the under chassis are also great visual reminders.

Colin has it right. I had a similar experience. Ever since, I keep a
digital camera close and take close-up pictures as the work
progresses. I can always check my work, and I have a set of pictures
afterwards to show off.
I also keep a scratch copy of the radio manual's component list and
schematic that I mark up during the job. When I hand the radio over to
the owner, I can show him exactly what I did to restore the radio.

I will add to what is on this page that the flat molded
caps are often also mica types, however, they are not
silvered micas. They are simply stacks of alternating mica
dielectric and foil plates. They are not as reliable or high
performance as silvered micas and should be checked. These
were used mostly in high voltage applications or where waxed
paper had too much loss.
Black Beauty caps are not exactly paper dielectric but
used paper impregnated with a polyester. They _should_ have
been low loss and quite reliable but became notorious within
a few years of their manufacture for developing high losses.
I suspect this may have been due to some problem with the
molded casing because Sprague sold capacotors with a similar
construction but in dipped epoxy casing as Orange Drops and
I have not heard that they shared the same short life

problems.
BTW, while silvered mica caps are generally very reliable they can still go bad. I've had to replace quite a few in rebuilding a couple of SP-600-JX's due to instability. Here again all were molded bakelite cases so I suspect either the case or perhaps end connections. Again, the dipped epoxy mica caps do not seem to suffer from this problem.

Every ham should have the chance to browse through a store like Nortex. It was literally one of those hole-in-the-wall places; it was off the beaten track just enough that you'd never find it by chance. I don't know if he ever advertised the place, but if you tinkered with electronics in Fort Worth long enough you were bound to hear of the place. I worked at the Fort Worth Museum of Science and History during the 1980s and I have absolutely no doubt in my mind that we bought some stuff from Nortex; a lot of the equipment and parts for sale there simply could not be found anyplace else.

One ENTIRE WALL was filled with vacuum tubes. Most of them were still in the little cardboard boxes. I don't think he had anything in there younger than 10 years old bare minimum; much of it no doubt older than me. Lots and lots of Tektronix oscilloscope modules and microwave stuff; carbon-comp resistors; old VTRs from local TV stations; 16mm film projectors; plenty of old books and magazines. Plenty of sockets, connectors, plugs, cables. And let us not forget panel meters! Plenty of knobs, transformers, inductors.

And probably more junk video monitors of various types in one place, at least above the surface of the ground.

Yes, indeed, it was great fun to prowl through. I'm gonna miss it. Last time I was there was about eight months ago and the poor gentleman looked to be in very sad shape even then. My thanks to him for supplying local hams with a fun place to hunt for parts and whatnot.

73,

Matt J. McCullar, KJ5BA
Arlington, TX

I wonder how common that experience was?

When I was a kid, about 1974, about three years after I first went into
an electronic store (it was Etco Electronics here in Montreal, which did
mail order so maybe some remember it), I heard from two very different
people about some store where "you can buy a handful of resistors for
5cents" or words to that effect. Both people spoke of it in legendary
terms, and had yet to visit it so they'd heard of it from someone else.

I went with one of them, and it was like a supermarket, complete with baskets
at the door. A mixture of industrial surplus and components for tv
and radio repair.

It's also the only local place remaining from back then, the only place
still with wooden floors and like the old school of electronic store.

And any time someone asks about getting components in the local newsgroup,
invariably someone mentions the place, far ahead of the fancier electronic
distributors that have risen up in more recent years (and actually which
have been around for decades at this point, but never match the feel
of those old stores).

In Seattle, it was Nuclear Electronics, run by Jeff Atwood... with LOTS of
neat-o antique/surplus "junque". It was worth the long bicycle ride for
this teenage kid who was a new ham!

Dear friends of the Iron, Glass, and Oil:

Nortex Electronics is being 'reconstituted'.

No more info is available now.

Latest news will be posted to this web page as it is made available:

Yes, the flat molded micas are starting to show their age. Although generally more reliable than paper, I have found some bad ones in recent 1940s TV projects.

When in doubt, check 'em!

I read somewhere else that the plastic casing in Black Beauties, etc., developed microscopic cracks and admitted water vapor over the years, causing the same problems as in paper caps.

Anyone have a copy of the magazine article (73?) that is purported to have modifications for the Heathkit HR-10B ham band receiver? While in Boston, I picked up one of these little green guys at the MIT monthly ham flea market this weekend and before I go through the radio, I'd like to get my ducks in a row, modification-wise.
thanks
Bob

But which article? The one in 1967, which was the "Canadian Issue" so it
must have been July? That one was written by a Canadian, and I can't remember
what was in there.

There was also one in the November 1972 issue of 73, again I can't remember
what was in there.

I also think there might have been a brief bit somewhere along the way, of
a power supply modification, but that might have been in one of the major
articles.

I can picture both articles as having a few mods each, but I may
be mixing them up. Somewhere in one of them was a bit about improving
the selectivity, which is the most specific detail I remember.

I rescued a hammarlund HQ-180 from the scrap pile. The front panel is
a little rusty but overall
not too bad a condition. The chassis seems to have some kind of very
thick greasy scum on it.
It does not appear to be tobacco smoke but a clear substance. I'll
have to experiment and see
what will remove it.

That may be, they certainly develop very large cracks
sometimes. I've disected a few BBs. The capacitor itself was
distorted, oddly flattened rather than being tubular.
Perhaps they were wound this way or perhaps some sort of
differential shrinkage of the encapsulation pushed them out
of shape. They were _supposed_ to be very long life, low
leakage, deluxe capacitors and are generally found in high
quality equipment.

I think the designers were using the best materials & technology available at the time. And they never imagined that people might be using or restoring these devices several decades beyond their expected service life. Most radios were considered appliances. Contemporary electronics, even cars for that matter, are not designed to remain in use forever. I remember when my Dad bought a Mercury in 1965, his one and only new car. What would the salesman have said if Dad had asked how that car might be running some 40-odd years later? Dad is still alive, bless his heart, but the car perished decades ago.

:-)

My memory is that the problems with the BBs began
showing up pretty soon after manufacture. For instance,
Hammarlund used them in SP-600 receivers made in the mid
1950's but the military was replacing them in mass with disc
ceramics by the late 1950's, so something must have changed
pretty rapidly. However, they were still being advertised in
the early 1960's so, perhaps, the problem was cured and it
was only the early versions that were bad.

Might be decades of cooking grease, who knows. Start with paint thinner (mineral spirits) and a soft, lint-free cloth. Denatured alcohol or even lacquer thinner if that doesn't work. Q-tips to clean up nooks and crannies. Don't get any moisture into places where it doesn't belong. Denatured alcohol will leave no residue. Keep solvents away from dial markings & any other painted stuff.

Whatever happens, don't run the chassis through the dishwasher, as some crackpots do :-)

I have paper copies (notes and some copies) of the HR-10B modifications
that you are asking about -- but have not found an Internet source.
Many of these are marginal to bad.
The voltage regulator tube mod for regulation of the VFO voltage
is probably the most popular.

Why modify it? It's a 40 year old entry level radio. Why try and make it
into something it was never meant to be? I respectfully suggest that you
just restore it to operational condition and enjoy it for what it is.

I may have to agree with Billy about not modifying the rig. I say "may" because I'm not aware of the mods listed - or how they might improve the radio if any. NOR have I heard of any rigs having been done - and any results.

Mods "can" be nice - if they "enhance" a radio's performance. However - most of the mods I see - tend to turn a radio to crap - more often than not. I've done some myself - and well - though I know they were done correctly - lets face it - the radio worked better as it was "intended" and it didn't take me long to put it back to normal. Then I've seen still other's that flat out made radios sound like pure garbage.

But in the grand scheme of things - based on my own experiences and not knowing the end results of said mods -I'm inclined to agree with Billy - retore it as it was meant to be - and enjoy the "relic" of the past. Besides, if you go to sell it again, it seems to me, it would fetch more - restored OR "original" - than butchered up.

Just my 2 cents.

I just recalled a few radios (transmitter/receiver/transceiver) - I was asked to "undo". One of which was a Drake. Though the work - "seemed" to be done "neatly" - it turned the rig into a pile of dung. The owner paid one guy to modify it - paid me to "un" modify it. Just goes to show - they're not always what they're cracked up to be/do.

What sort of connector is it? Is it a locking DIN? Is it a locking DIN
that screws down or just screws in partially?

I corresponded w/ the OP in other NGs and direct. It's a Kenwood TS130S. The "ACSY" or "REMOTE" (depending on where you're reading) connector is a circular 7-pin DIN. The "REMOTE VFO" connector is a circular 8-pin DIN connector (with one pin offset from the generic type). I've seen them offered for sale for ridiculous prices -- I easily modified generic (and inexpensive) plugs to fit.

There are actually a couple different 8-pin DIN connectors, just as there
are three different 5-pin DIN connectors. You should be able to get the
less common ones from Connector World Supply if you can actually find the
DIN spec numbers for them and if you do not require locking or Tuchel types.

2998. HCRA Auction - Feeding Hills, MA - November 2nd

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-10-28 04:22:34 UTC
From: Jim - KK1W <kk1w@charter.net>
Message-ID: <M7UUi.203$we7.60@newsfe02.lga>
Source record: 6552
Cross-posted to: rec.radio.swap,rec.radio.amateur.boatanchors

The annual HCRA auction will be held this coming Friday, November 2nd, in Feeding Hills, MA.

The auction is open to everyone and admission is free. We typically have over 100 people in attendance and a good time is always had by all.

If you would like to sell your items the rules are very simple:

1. Amateur radio or computer equipment only.
2. No CRT monitors please, we are not in the disposal business.
3. 10% of the selling price goes to the club, up to a maximum of $10. This means that any item selling for more than $100 you still only donate $10 to the HCRA.
4. Mark your items with your name, call (if you have one) and a minimum bid (if you want to).

The rest is up to us. We will endeavor to get as much as possible for the fine quality equipment you have brought. Depending on the turnout and time allotment the auctioneers reserve the right to combine small items into groups to move the auction along more quickly.

If you are a buyer all you need do is show up by 7:30 and have fun!

If you have some stuff you're too embarrassed to put your name on why not donate them to HCRA? We will happily get what we can for them and the money goes to help fund the auction for the following year!

In addition to the auction we have a great raffle going on. First prize in the raffle is a $250 gift certificate to HRO. Tickets are a $1 each or a book of 6 for $5.

Adding to the fun is coffee, donuts, soda and the best time ever for a Friday night. Stop paying those inflated eBay prices for ham radio 'stuff'. See it, smell it, touch it and buy it at the HCRA auction at a far better value.

Setup for the auction starts at 6:30 PM and the bidding starts at 7:30 PM. Sellers will not be allowed into the auction hall prior to this time so the chairs and tables can be set. Items will be auctioned off in the order received.

For more information including directions please visit:
http://www.hcra.org/auction_2005.htm

The auction is held at:

Feeding Hills Congregational Church
21 N. Westfield Street
Feeding Hills, MA 01030

For more information please contact:

I'm not the OP (original poster) -- I replied w/ info. As he intends to
interface a linear amplifier, he needs a nonlocking 7-pin plug such as:
http://search.digikey.com/scripts/DkSearch/dksus.dll?Detail?name=CP-1070-ND.

Its a 7 pin ACSY. I have not tried to plug anything into the male plug and have no experience with a TS-130S. It is the remote connector plug shown on page 5 of the manual. Don't know what all the locking etc means as no experience with this type of special Japanese connector at all!

A fellow from Avvid tells me the Kenwood part number is E07-0851-05 but a Kenwood search comes up not found. I sent them an e-mail

3008. D-104 Mics... how many kinds?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-10-28 22:29:21 UTC
From: "Rick (W-A-one-R-K-T)" <get.my.email@from.qrz.com>
Message-ID: <pan.2007.10.28.22.29.20.675989@from.qrz.com>
Source record: 6562

I'm looking on ebay for a D-104 microphone to use with my Heath Marauder transmitter, and I need to make sure I get the right one.

There seems to be differences between models... some are amplified, some are not; some are high impedance, and some are low.

The sellers for these mics are highly unlikely to know anything worth knowing about them it seems... so, which one do I need for my Marauder and how do I make sure I'm getting the right one?

Thanks...

The Heath Marauder normally accepts a high-Z mic, something at or above
a nominal 8-10k Ohms. A non-amplified D-104 will do the trick, nicely.
You may, however, also use an amplified D-104 by setting the gain of the
mic and the transmitter such that it does not flat-top (overmodulate),
as observed on a 'scope. I use both models but prefer the standard
model for the likes of older Johnson-Viking and Hallicrafters
transmitters. My take on the issue.

3010. The oldest coax

Newsgroup: rec.radio.amateur.boatanchors

OK guys heres a question for you.
What's the oldest coax you've got.
I found a piece today in the shop that a friend,
KN4R had given me years ago and I had forgotten about.
It's Amphenol RG8/U and it's dated June 1944.
That's pretty old for coax. I'll have to go
to some of my old ARRL handbooks and see when
the first ads for coax showed up.
Has anyone else seen any coax older than this?
Does anyone know when it was first introduced?

73, W4RON

From http://www.britannica.com/eb/topic-123218/coaxial-cable
coaxial cable, which first gained widespread use during World War II

From
http://searchdatacenter.techtarget.com/sDefinition/0,,sid80_gci211806,00.html

Coaxial cable was invented in 1929 and first used commercially in 1941. AT&T
established its first cross-continental coaxial transmission system in 1940.

But http://en.wikipedia.org/wiki/Coaxial_Cable
sez
a.. 1880 - Coaxial cable patented in England by Oliver Heaviside, patent no.
1,407.
a.. 1884 - Coaxial cable patented in Germany by Ernst Werner von Siemens,
but with no known application. [citation needed]
a.. 1894 - Oliver Lodge demonstrates waveguide transmission at the Royal
Institution. Nikola Tesla receives U.S. Patent 0,514,167 , Electrical
Conductor, on February 6.
a.. 1929 - First modern coaxial cable patented by Lloyd Espenschied and
Herman Affel of AT&T's Bell Telephone Laboratories, U.S. Patent 1,835,031 .

It's a German connector. DIN stands for German Industry Standard. And yes,
I think the connector you want _is_ a standard DIN type, just not a very
common one.

Some of the DIN connectors have a locking collar on them to lock them into
place, and there are several variants of these. One is an actual DIN standard
one is a Tuchel company type, and the other I'm not really sure about. You
clearly don't have any of these, otherwise you'd know it.

What you need is a standard number or a manufacturer's number. If you call
Connector World Supply in Seattle and send them a photo, they may be able to
match it for you. They are good folks at tracking down oddities.

And some of the high-Z ones have crystal elements, while others have
dynamic alements with step-up transformers.

You need a high-Z unbalanced input. You do not want a crystal element
mike, because the elements fail and cannot easily be replaced. Beyond
that, there are a bunch of variants that will work fine.
